Why do peoples' voices sound different when they're talking on the phone?

Some people say I sound like my mom when I'm talking to them on the phone, which I think is sort of weird... because I was adopted... Today I was talking to my boyfriend on the phone... This was the first time I've talked to him on the phone... (we've only been going out for like a week). His voice sounded a little deeper or something. Or could that just be because he was nervous?

4 years ago [Report Abuse](#)

Paul_196...

Best Answer - Chosen by Asker

One major reason for voices sounding different is that the frequency response of the telephone system is limited. The range of the human ear can extend right up 20kHz or more, especially in younger people. A connection over the telephone has a much narrower bandwidth, typically restricting the highest frequencies transmitted to a little over 3kHz in many cases.

That's adequate to convey intelligible speech, but naturally it changes the sound of the voice subtly by filtering out the highest-pitched components. It's the same sort of effect as you would get by listening to your favorite record on A.M. radio versus listening to it on F.M. or from a CD.

The telephone also reduces frequencies at the very lowest end of the audible range as well.

Artificial Neural Networks Machine Learning [✎ Edit](#)

How do convolutional neural networks work? [✎ Edit](#)

Especially, what kind of benefits does convolution give you? [✎ Edit](#)

[♥ Comment](#) [🗨 Post \(1\)](#) · [Wiki](#) · [Options](#) · [Redirect Question](#)

Convolutional neural networks work like learnable local filters.

The best example is probably their application to computer vision. The first step in image analysis is often to perform some local filtering of the image, for example, to enhance edges in the image.

You do this by taking the neighborhood of each pixel and convolve it with a certain mask (set of weights). Basically you compute a linear combination of those pixels. For example, if you have a positive weight on the center pixel and negative weights on the surrounding pixels you compute the difference between the center pixel and the surrounding, giving you a crude kind of edge detector.

Now you can either put that filter in there by hand or learn the right filter through a convolutional neural network. If we consider the simplest case, you have an input layer representing all pixels in your image while the output layer representing the filter responses. Each node in the output layer is connected to a pixel and its neighborhood in the input layer. So far, so good. What makes convolutional neural networks special is that the weights are shared, that is, they are the same for different pixels in the image (but different with respect to the position relative to the center pixel). That way you effectively learn a filter, which also turns out to be suited to the problem you are trying to learn.

Advantages of Community Question Answering

- Could solve information needs that are **personal**, **heterogeneous**, **specific**, **open-ended**, and **cannot** be expressed as a **short query**
- **No single Web page** will directly answer these complex and heterogeneous needs, **CQA users** should understand and answer better than a machine
- Have accumulated rich knowledge
 - More than **one billion** posted **answers** in Yahoo! Answers
<http://yanswersblog.com/index.php/archives/2010/05/03/1-billion-answers-served/>
 - More than **190 million resolved questions** in Baidu Zhidao
 - In China, **25%** of Google's top-search-results page contain at least one link to some Q&A site, Si et al., VLDB, 2010

Ask a Question

[Home](#) > Ask Question

1 What's Your Question

What should i do if my laptop got blue screen?

You have **64** characters left.

Now add a little more detail (optional)

Make sure your question follows the [community guidelines](#).

[Continue](#)

Problem and Opportunity

- Problem
 - Askers need to wait some time to get an answer, **time lag**
 - **15%** of the questions **do not receive any answer** in Yahoo! Answers, which is one of the first CQA sites on the Web
- Opportunity
 - **25%** questions in certain categories are recurrent, **Anna, Gideon and Yoelle, WWW, 2012**
- Answer **new questions** by reusing **past resolved questions**
- **Question Retrieval**: find **semantically similar** past questions for a new question

Question Retrieval Example

I just got a random blue screen of death, should I be worried?

...just suddenly **got** a random **blue screen** of death. I've never **got** one on this **laptop** before, and I've had no problems with **my laptop** at all until this bsod.... It said that **if** it was **my** first time...free. I don't even remember **what** sites I was on...with no problems. I **do** remember that the programs...off bsod like **my old laptop?** Or **should I** be worried? ...

1 ★ In Other - Hardware - Asked by Kaylee - 6 answers - 2 weeks ago

why is my laptop showing the blue screen?

...to it, so I'm not sure **if** they could have **done** anything, but now when I turn **my laptop** on i would **get** a **blue screen** saying all this jumble...a boot disk, so i dont know **what** else **should i do**. Any help/advice?

★ In Laptops & Notebooks - Asked by doodlec - 6 answers - 5 years ago

Laptop blue screen problem!!!?

...malicious URL block and then this **blue screen** comes up and **my laptop** turns off and asks **me if** I want to go into safe mode. **What should I do?** Is there any way...for a new **laptop** cause I **got** low practice SAT scores...

★ In Laptops & Notebooks - Asked by Mathew Colman - 5 answers - 10 months ago

sony vaio blue screen problem, what should i do? please help?

Benefit of Question Retrieval

- Provide an alternative to **automatic question answering**
- Help askers get an answer in a **timely manner**
- Guide answerers to answer **unique questions**, better utilize users' answering passion

Notations

Symbol	Description
Q	A new question
D	A candidate question
$ \cdot $	Length of the text
C	Background collection
w	A term in the new question
t	A term in a candidate question

- 5 References

Lexical-based Approach: Language Model

- In language modeling, similarity between a **query** and a **document** is given by the **probability** of generating the query from the document language model
- Unigram language model, i.i.d. sampling

$$P(Q|D) = \prod_{w \in Q} P(w|D)$$

- In **question retrieval** syntax, query is the **new question**, document is a **candidate question**

Lexical-based Approach: Language Model

- To **avoid zero probabilities** and estimate more accurate language models, documents are **smoothed** using a background collection

$$P(w|D) = (1 - \lambda)P_{ml}(w|D) + \lambda P_{ml}(w|C)$$

- λ is a smoothing parameter, $0 \leq \lambda \leq 1$

$$P_{ml}(w|D) = \frac{\text{termfrequency}(w, D)}{\sum_{w' \in D} \text{termfrequency}(w', D)}$$

- Maximum likelihood estimator** to calculate $P_{ml}(\cdot)$

Lexical-based Approach: Translation Model

LM	
Advantage	Simple
Disadvantage	Lexical Gap

- **Lexical Gap**, two questions that have the same meaning use very different wording
 - Is downloading movies illegal?
 - Can I share a copy of a DVD online?
- Jiwoon Jeon, W. Bruce Croft and Joon Ho Lee, Finding Similar Questions in Large Question and Answer Archives, CIKM, 2005

Lexical-based Approach: Translation Model

Language Model
$P(w D) = (1 - \lambda)P_{ml}(w D) + \lambda P_{ml}(w C)$
Translation Model
$P(w D) = (1 - \lambda) \sum_{t \in D} (T(w t)P_{ml}(t D)) + \lambda P_{ml}(w C)$

- $T(w|t)$ is the **probability** that word w is the **translation** of word t , denotes **semantic similarities** between words

Lexical-based Approach: Translation Model

Table: Questions share few common words, but may have high semantic relatedness according to translation model

Id like to insert music into PowerPoint. How can I link sounds in PowerPoint?
How can I shut down my system in Dos-mode. How to turn off computers in Dos-mode.
Photo transfer from cell phones to computers. How to move photos taken by cell phones.
Which application can run bin files? I download a game. How can I execute bin files?

Rank	bmp	format	music	intel	excel	font	watch	memory
1	bmp	format	music	pentium	excel	font	watch	memory
2	jpg	format*	file	4	korean	korean	time	virtual
3	gif	xp	tag	celeron	function	97	background	shortage
4	save	windows	sound	amd	novice	add	start	ram
5	file	hard	background	intel	cell	download	date	message
6	picture	98	song	performance	disappear	control-panel	display	configuration
7	change	partition	play	support	convert	register	tray	256
8	ms-paint	drive	mp3	question	if	install	power	extend
9	convert	disk	cd	buy	xls	default	screen	system
10	photo	C	source	cpu	record	photoshop	wrong	windows

Figure: The first row shows the source words and each column shows top 10 words that are most semantically similar to the source word. A higher rank means a larger $T(w|t)$ value

Lexical-based Approach: Translation Model

- How to learn $T(w|t)$?
 - Prepare a **monolingual parallel corpus** of pairs of text, each pair should be **semantically similar**
 - Employ machine translation model **IBM model 1** on the parallel corpus to learn $T(w|t)$
- How this paper prepares monolingual parallel corpus
 - Each pair contains **two questions** whose **answers** are very similar

Lexical-based Approach: Translation Model

- Delphine Bernhard and Iryna Gurevych, Combining Lexical Semantic Resources with Question & Answer Archives for Translation-Based Answer Finding, ACL, 2009
- Propose and several methods to prepare parallel monolingual corpora
 - Question answer pairs: question \leftrightarrow answer
 - Question reformulation pairs: question \leftrightarrow question reformulation by user

Lexical-based Approach: Translation Model

RUClimate (supervisor) [332] merged the question **Why iare clouds white** into **Why are clouds white** 9 Feb 2012 17:03

RUClimate (supervisor) [332] merged the question **What makes the clouds appeared to be white** into **Why are clouds white** 9 Feb 2012 16:44

RUClimate (supervisor) [332] merged the question **Why does Clouds appear white** into **Why are clouds white** 9 Feb 2012 16:44

RUClimate (supervisor) [332] merged the question **Why do clouds appear white** into **Why are clouds white** 9 Feb 2012 16:43

RUClimate (supervisor) [332] merged the question **Why do clouds look white** into **Why are clouds white** 9 Feb 2012 16:43

RUClimate (supervisor) [332] merged the question **Why do clouds in the sky appear white** into **Why are clouds white** 9 Feb 2012 16:43

RUClimate (supervisor) [332] merged the question **How does the cloud is white** into **Why are clouds white** 9 Feb 2012 16:43

Lexical-based Approach: Translation Model

- Lexical Semantic Resources: **glosses** and **definitions** for the same lexeme in **different lexical semantic and encyclopedic resources** can be considered as **near-paraphrases**, since they define the **same terms** and hence have the same meaning
- **moon**
 - **Wordnet**: the natural satellite of the Earth
 - **English Wiktionary**: the Moon, the satellite of planet Earth
 - **English Wikipedia**: the Moon (Latin: Luna) is Earth's only natural satellite and the fifth largest natural satellite in the Solar System

Lexical-based Approach: Translation-based Language Model

TM	
Advantage	Tackle lexical gap to some extent
Disadvantage	$T(w w) = 1$ for all w while maintaining other word translation probabilities unchanged, produce inconsistent probability estimates and make the model unstable

- Xiaobing Xue, Jiwoon Jeon and W. Bruce Croft, Retrieval Models for Question and Answer Archives, SiGIR, 2008
- Translation-based Language Model

Lexical-based Approach: Translation-based Language Model

Translation Model
$P(w D) = (1 - \lambda) \sum_{t \in D} (T(w t)P_{ml}(t D)) + \lambda P_{ml}(w C)$
Translation-based Language Model
$P(w D) = \frac{ D }{ D +\lambda} P_{mx}(w D) + \frac{\lambda}{ D +\lambda} P_{ml}(w C)$ $P_{mx}(w D) = (1 - \beta)P_{ml}(w D) + \beta \sum_{t \in D} T(w t)P_{ml}(t D)$

- Linear combination of **language model** and **translation model**
- **Answer part** should provide additional evidence about relevance, incorporating the answer part

$$P_{mx}(w|(D, A)) = \alpha P_{ml}(w|D) + \beta \sum_{t \in D} T(w|t)P_{ml}(t|D) + \gamma P_{ml}(w|A)$$

$$\alpha + \beta + \gamma = 1$$

Syntactic-based Approach: Syntactic Tree Matching

- Some similar questions neither share many common words, nor follow identical syntactic structure
 - How can I lose weight in a few months?
 - Are there any ways of losing pound in a short period?
- Kai Wang, Zhaoyan Ming and Tat-Seng Chua, A Syntactic Tree Matching Approach to Finding Similar Questions in Community-based QA Services, SIGIR, 2009
- Syntactic tree matching

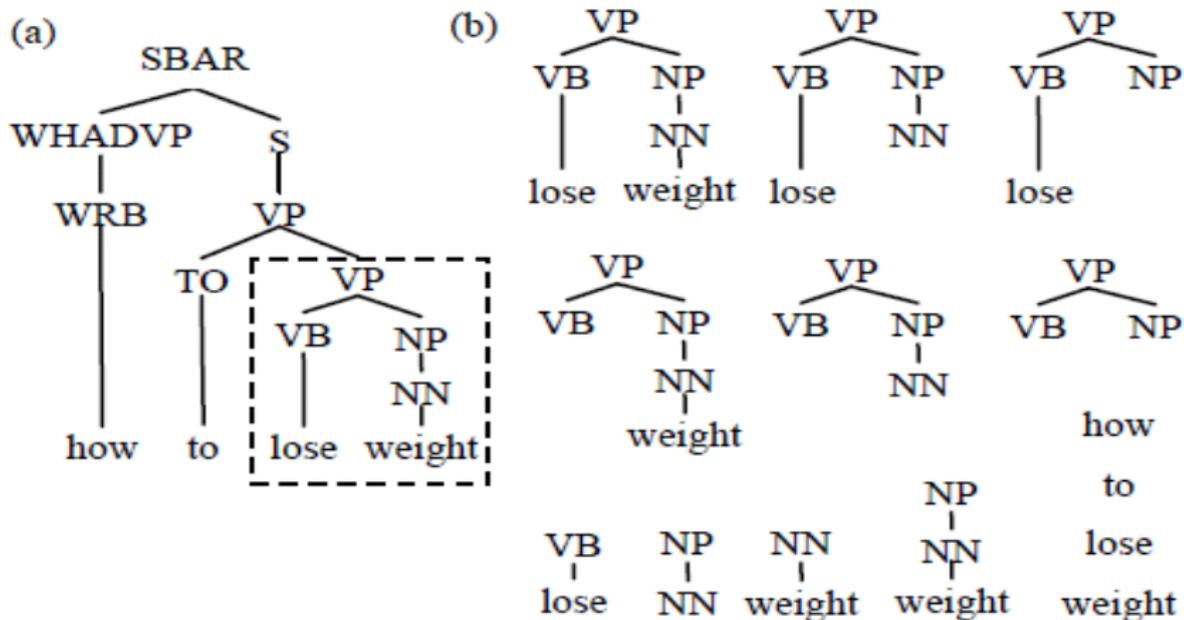

Figure: (a) The Syntactic Tree of the Question "How to lose weight?". (b) Tree Fragments of the Sub-tree covering "lose weight".

Syntactic-based Approach: Syntactic Tree Matching

- Tree kernel: utilize structural or syntactic information to capture higher order dependencies between grammar rules

$$k(T_1, T_2) = \sum_{n_1 \in N_1} \sum_{n_2 \in N_2} C(n_1, n_2)$$

- N_1, N_2 are sets of nodes in two syntactic trees T_1 and T_2 , and $C(n_1, n_2)$ equals to the number of common fragments rooted in n_1 and n_2

Syntactic-based Approach: Syntactic Tree Matching

- Limitation of tree kernel
 - Tree kernel function merely relies on the intuition of **counting the common number of sub-trees**, whereas the number **might not be a good indicator** of the similarity between two questions
 - Two evaluated sub-trees have to be identical to allow further parent matching, for which **semantic representations cannot fit in well**
- Syntactic tree matching
 - A new weighting scheme for tree fragments that are robust against some grammatical errors
 - Incorporate semantic features

Motivation

- Question Recommendation
 - Retrieve and rank other questions according to their likelihood of being **good recommendations** of the **queried question**
 - A good recommendation provides **alternative aspects around users' interest**

Example

Queried question:

Any cool clubs in Berlin or Hamburg?

Question search:

What are the best/most fun clubs in Berlin?

Question recommendation

How far is it from Berlin to Hamburg?

Where to see between Hamburg and Berlin?

Hong long does it take to get to Hamburg from Berlin on the train?

Cheap hotel in Hamburg?

Question Recommendation: MDL-based Tree Cut Model

- Yunbo Cao, Huizhong Duan, Chin-Yew Lin, Yong Yu and Hsiao-Wuen Hon, Recommending Questions Using the MDL-based Tree Cut Model, WWW, 2008
- Step 1: Represent questions as **graphs of topic terms**
- Step 2: Rank recommendations on the **basis of the graphs**
- Formalize both steps as the **tree-cutting** problems and employ the **MDL (Minimum Description Length)** for selecting the best cuts

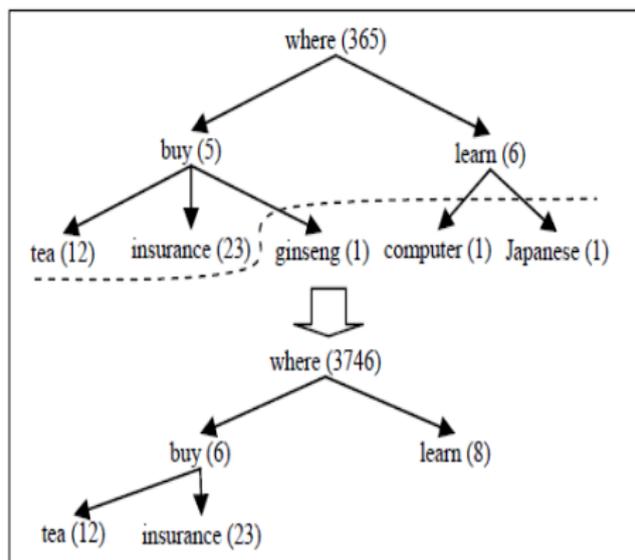

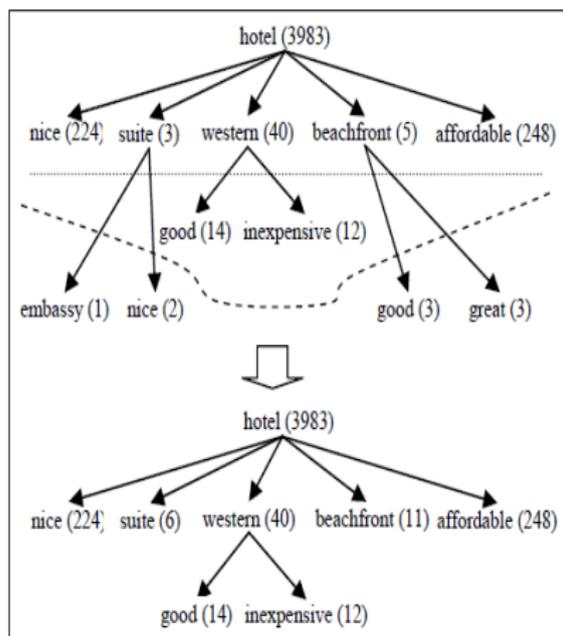

Question Recommendation: MDL-based Tree Cut Model

- Question
 - Any cool clubs in Berlin or Hamburg?
- Question topic
 - Major **context/constraint** of a question, characterize users' interests
 - Berlin, Hamburg
- Question focus
 - Certain **aspect** of the **question topic**
 - cool club
- Suggest alternative **aspects** of the queries question topic

Question Recommendation: MDL-based Tree Cut Model

- Extraction of topic terms: base noun phrase, WH-ngram
- Reduction of topic terms: MDL-based tree cut model

Question Recommendation: MDL-based Tree Cut Model

- Topic profile
 - Probability distribution of categories $\{p(c|t)\}_{c \in C}$
 - $p(c|t) = \frac{\text{count}(c,t)}{\sum_{c \in C} \text{count}(c,t)}$
 - $\text{count}(c, t)$ is the frequency of the topic term t within the category c
- Specificity
 - Inverse of the entropy of the topic profile
 - Topic term of **high specificity** usually specifies **question topic**
 - Topic term of low specificity is usually used to represent **question focus**
- Topic chain
 - Topic chain is a sequence of ordered topic terms sorted from big to small according to specificity
- Question tree
 - Prefix tree built over topic chains of the question set Q

Question Recommendation: MDL-based Tree Cut Model

- Ranking recommendation candidates
 - Determine what **topic terms (question focus)** should be substituted
 - Collect a set of **topic chains** $Q^c = \{q_i^c\}_{i=1}^N$ such that at least one topic term occurs in both q^c and q_i^c
 - Construct a **question tree** from the set of topic chains $Q^c \cup q^c$
 - Employ MDL to separate topic chains into **Head, H** and **Tail, T**
 - Score recommendation candidates rendered by various substitutions
 - Specificity: the more similar are $H(q^c)$ and $H(\hat{q}^c)$, the **higher** score
 - Generality: the more similar are $T(q^c)$ and $T(\hat{q}^c)$, the **lower** score

Question Subjectivity Analysis

- **Question Analysis** is to analyze characteristics of questions
- Understand **User Intent**
- Provide **rich information** to question search, question recommendation, answer quality prediction, etc.
- **Question Subjectivity Analysis** is an important aspect of **question analysis**

Question Subjectivity Analysis: Definition

- Subjective question
 - Private statements
 - Personal opinion and experience
 - What's the difference between chemotherapy and radiation treatments?
- Objective question
 - Objective, verifiable information
 - Often with support from reliable sources
 - Has anyone got one of those home blood pressure monitors? and if so what make is it and do you think they are worth getting?

Question Subjectivity Analysis: Motivation

- More accurately identify **similar questions**, improve **question search**
- Better **rank or filter** the answers based on whether an answer matches the question orientation
- Crucial component of inferring **user intent**, a long-standing problem in Web search
- **Route** subjective questions to **users** for answer, **trigger automatic factual question answering** system for objective questions

Question Subjectivity Analysis: Challenge

- Ill-formatted, e.g., word capitalization may be incorrect or missing, consecutive words may be concatenated
- Ungrammatical, include common online idioms, e.g., using “u” means “you”, “2” means “to”

Resolved Question [Show me another >](#)

Has anyone got one of those home blood pressure monitors?

and if so what make is it and do you think they are worth getting?

Best Answer - Chosen by Voters

hi, if you are in the UK the ones lloyds pharmacy sell for £9.99 are very good. You would be better getting a proper one with arm cuff rather than the wrist ones, I have found these inaccurate. If you have problems with your blood pressure it may be worth getting one, but only if you know what you are doing, what the reading actually means and what is abnormal in you.

A lot of people buy these machines and do not know what the results mean and this can lead to stress and .. high blood pressure !!

Other Answers (9)

Yes indeed. It helps to monitor blood pressure. It is really worth having one at Home. Very handy.

- Co-training, two views of the data, **question** and **answer**

Figure: Yahoo Answers Example.

Input:

- F_Q and F_A are *Question* and *Answer* feature views
- C_Q and C_A are classifiers trained on F_Q and F_A respectively
- L is a set of labeled training examples
- U is a set of unlabeled examples
- K : Number of unlabeled examples to choose on each iteration
- X : the threshold for increment
- R : the maximal number of iterations

Algorithm CoCQA

1. Train C_Q, θ on $L: F_Q$, and record resulting $ACC_{Q, \theta}$
2. Train C_A, θ on $L: F_A$, and record resulting $ACC_{A, \theta}$
3. **for** $j=1$ to R **do**:
 - Use C_{Qj-1} to predict labels for U and choose top K items with highest confidence $\rightarrow E_{Q, j-1}$
 - Use C_{Aj-1} to predict labels for U and choose top K items with highest confidence $\rightarrow E_{A, j-1}$
 - Move examples $E_{Q, j-1} \cup E_{A, j-1} \rightarrow L$
 - Train C_{Qj} on $L: F_Q$ and record training ACC_{Qj}
 - Train C_{Aj} on $L: F_A$ and record training ACC_{Aj}
 - if** $Max(\Delta ACC_{Qj}, \Delta ACC_{Aj}) < X$ **break**
4. **return** final classifiers $C_{Qj} \rightarrow C_Q$ and $C_{Aj} \rightarrow C_A$

- At step 1,2, each category has **top K_j** most confident examples chosen as additional **“labeled”** data
- Terminate when the increments of both classifiers are **less** than **threshold X** or **maximum number of iterations** are exceeded

Question Subjectivity Analysis: Semi-Supervised Learning

- Obtain **two classifiers** after CoCQA terminates
- **Classify** a new example with **two classifiers** based on **both of the feature sets**
- **Multiply** the confidence values, choose the class that has the highest product

- Li et al. 2008 (supervised), Li et al. 2008 (CoCQA, semi-supervised) based on manual labeling data
- **Manual labeling** data is quite **expensive**

Question Subjectivity Analysis: Data-driven Approach

Web-scale learning is to use available large-scale data rather than hoping for annotated data that isn't available

- Halevy, Norvig and Pereira

Question Subjectivity Analysis: Data-driven Approach

Whether we can utilize **social signals** to collect **training data** for question subjectivity identification with **NO** manual labeling?

- Like Signal: like an answer if they find the answer useful
- Intuition
 - Subjective: answers are **opinions, different tastes**; best answer receives **similar number of likes** with other answers
 - Objective: like an answer which explains **universal truth** in most detail; best answer receives **high likes** than other answers

- Vote Signal: users could vote for **best answer**
- Intuition
 - Subjective: vote for different answers, **support** different **opinions**; **low percentage** of votes on best answer
 - Objective: easy to identify answer contain the **most fact**; percentage of votes of best answer is **high**

Who invented the computer mouse?

does anyone know who invented the first Computer mouse and when was it invented?

3 years ago [Report Abuse](#)

Best Answer - Chosen by Asker

A guy called Engelbart - here it is
<http://sloan.stanford.edu/MouseSite/Arch...>

...mmmmm, sweet!!

Inventors of the Modern Computer
The History of the Computer Mouse and the Prototype for Windows - Douglas Engelbart
 by [Mary Bellis](#)

"It would be wonderful if I can inspire others, who are struggling to realize their dreams, to say 'if this country kid could do it, let me keep slogging away'." - Douglas Engelbart

- Source Signal: **reference** to **authoritative** resources
- Intuition
 - **Only available** for **objective** question that has **fact** answer

Question Subjectivity Analysis: Data-driven Approach

- Poll and Survey signal
 - User intent is to seek **opinions**
 - Very likely to be **subjective**
-
- What is something you learned in school that you think is useful to you today?
 - If you could be a cartoon character, who would you want to be?

Question Subjectivity Analysis: Data-driven Approach

- Answer Number signal: the **number of posted answers** to each question
- Intuition
 - Subjective: alertpost opinions even they notice there are **other answers**
 - Objective: **may not post** answers to questions that has received other answers since an **expected** answer is usually fixed
 - A **large answer number** indicate **subjectivity**
 - A **small** answer number may be due to many reasons, such as **objectivity**, small **page views**

Question Subjectivity Analysis: Data-driven Approach

Summary of Social Signals		
Name	Description	Training Data
Like	Capture users' tastes	Positive && Negative
Vote	Reflect users' judgments	Positive && Negative
Source	Measure confidence on authoritativeness	Negative
Poll and Survey	Indicate users' intent	Positive
Answer Number	Imply users' willingness to answer a question	Positive

Question Subjectivity Analysis: Data-driven Approach

- Features
 - Word: term frequency
 - Word n-gram: term frequency
 - Question length: information needs of subjective questions are **complex**, users use **descriptions** to explain, **larger question length**
 - Request word: particular words to explicitly indicate their **request** for seeking **opinions**; manual list of 9 words

Question Subjectivity Analysis: Data-driven Approach

- Subjectivity clue: **external** lexicon, over 8000 clues, manually compiled word list from **news** to express opinions
- Punctuation density: density of **punctuation marks**
- Grammatical modifier: inspired by **opinion mining** research of using **grammatical modifiers** on judging users' opinions, **adjective** and **adverb**
- Entity: objective question expects fact answer, leading to **less relationships** among entities, subjective questions contains more descriptions, may involve relatively **complex relations**
