

# **Part III. High-Throughput Sequencing and Applications**

# Why Sequence DNA?

- All genes available for an organism to use -- a very important tool for biologists
- Not just sequence of genes, but also positioning of genes and sequences of regulatory regions

# Evolution of Sequencing Technology

## First Generation Sequencing

- *Sanger Sequencing* [1977]

## Next (or second) Generation Sequencing (NGS)

- *Massively parallel sequencing* [2006/2007]

## Third Generation Sequencing

- *Singel molecule sequencing* [2013]

## Fourth Generation Sequencing?

High-Throughput Sequencing (HTS)

# The Advancement of HTS by Human Genome Project

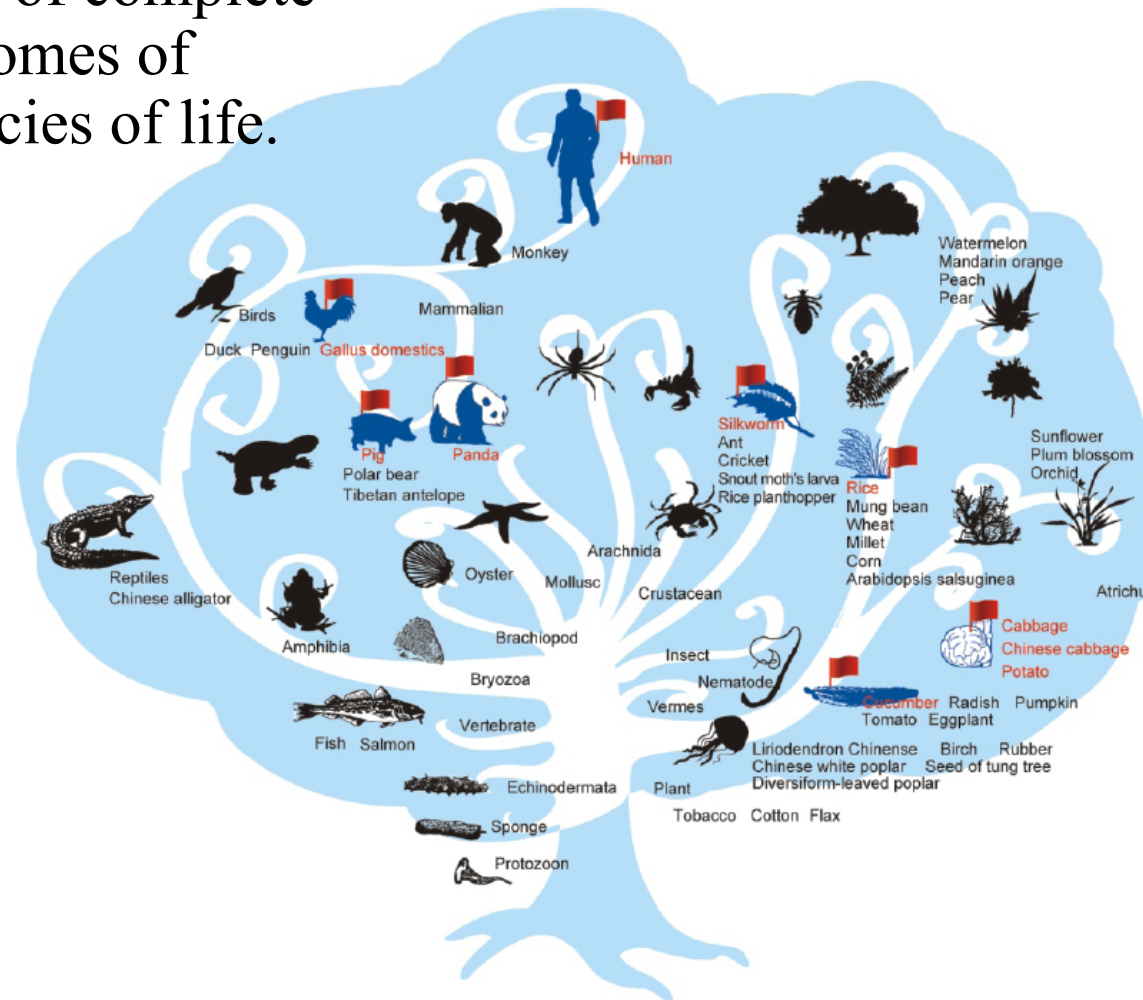

- It all starts with human genome project (1990).
  - What is in “the book of life”?
  - How many genes are there in human genome?
  - The International Human Genome Sequencing Consortium published their analysis of the 'draft' sequence in February 2001; and the finished, 'gold standard' sequence in 2004.

# HTS advantages:

- Rapid
- Low cost
- Enables the sequencing of complete DNA sequences, or genomes of numerous types and species of life.

Mass sequencing

# HTS Sequencers

Next generation sequencers

- 454 / Roche sequencing
- Illumina (Solexa) sequencing
- SOLiD systems
- Ion Torrent sequencing

Third generation sequencers

- PacBio RS II (Pacific Biosciences)
- MinION (Oxford Nanopore)

<b>System Overview</b>	Power and efficiency for large-scale genomics.		Maximum throughput and lowest cost for production-scale genomics.	Maximum throughput and lowest cost for production-scale genomics.	Maximum throughput for production-scale human whole-genome sequencing.		Maximum throughput and lowest cost population-scale human whole-genome sequencing.				

# Comparison of Sequencing Technologies

Sequencer	Sanger 3730xl	454 GS	Ion Torrent	SOLiDv4	Illumina HiSeq 2000	Pac Bio
Mechanism	Dideoxy chain termination	Pyrosequencing	Detection of hydrogen ion	Ligation and two-base coding	Reversible nucleotides	Single molecule real time
Read length	400-900 bp	700 bp	~400 bp	50 + 50 bp	100 bp PE	1000~10000 bp
Error Rate	0.001%	0.1%	2%	0.1%	2%	10-15%
Output data (per run)	100 KB	1 GB	100 GB	100 GB	1 TB	10 GB

# Increase in Sequencing Capacity

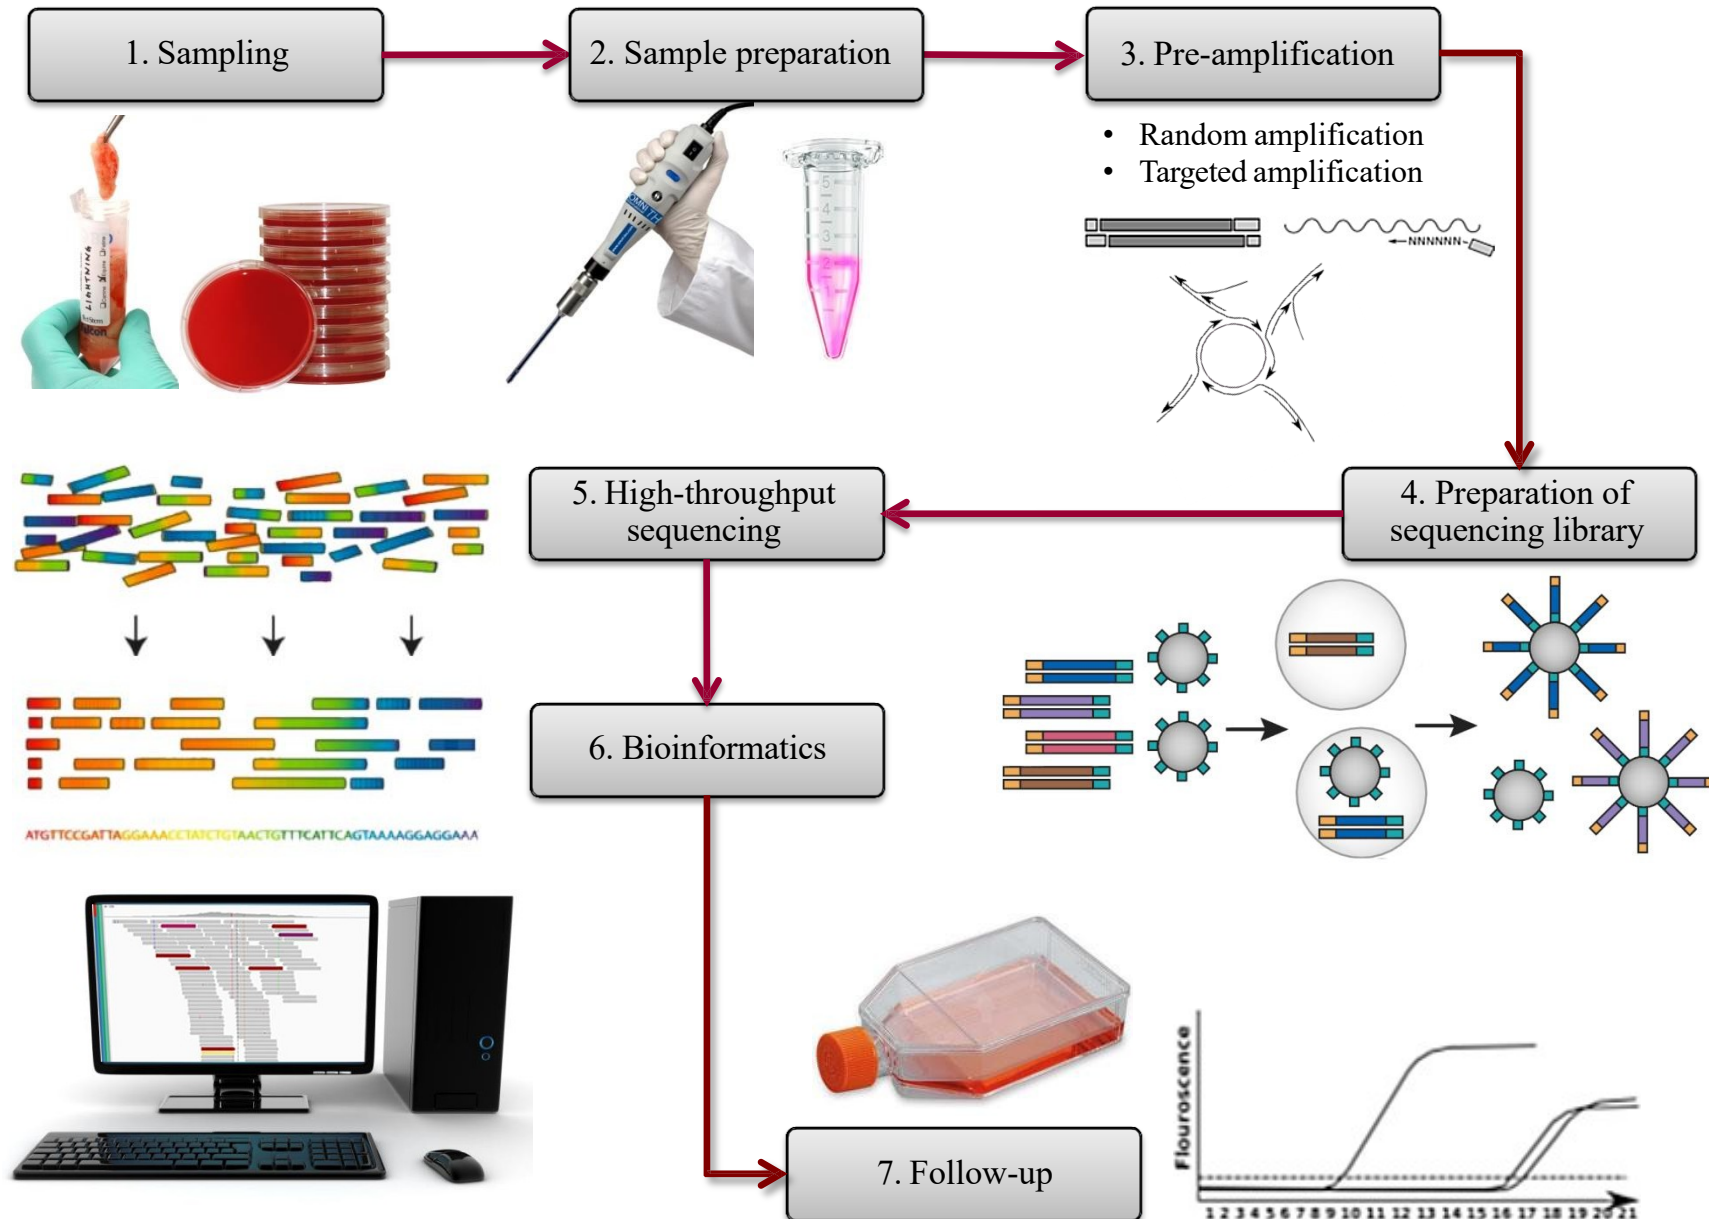

*Graph from Macmillan Publishers Ltd: Nature 458, 719-724 (2009)*

# Decrease in Sequencing Costs

*Data from the NHGRI Genome Sequencing Program (GSP)*

# General Methodology for HTS

# GENOME SEQUENCING

# 1. Sampling

- Clinical material
  - Collect samples according to applicable recommendations
  - Safe transport & storage of samples (prevent degeneration)
  - Correct & complete documentation
- Cultivated material
  - Normal laboratory procedures

## 2. Sample Preparation

- Homogenization
- Filtration
- Enrichment
  - Ultracentrifugation
- Extraction (RNA or DNA)

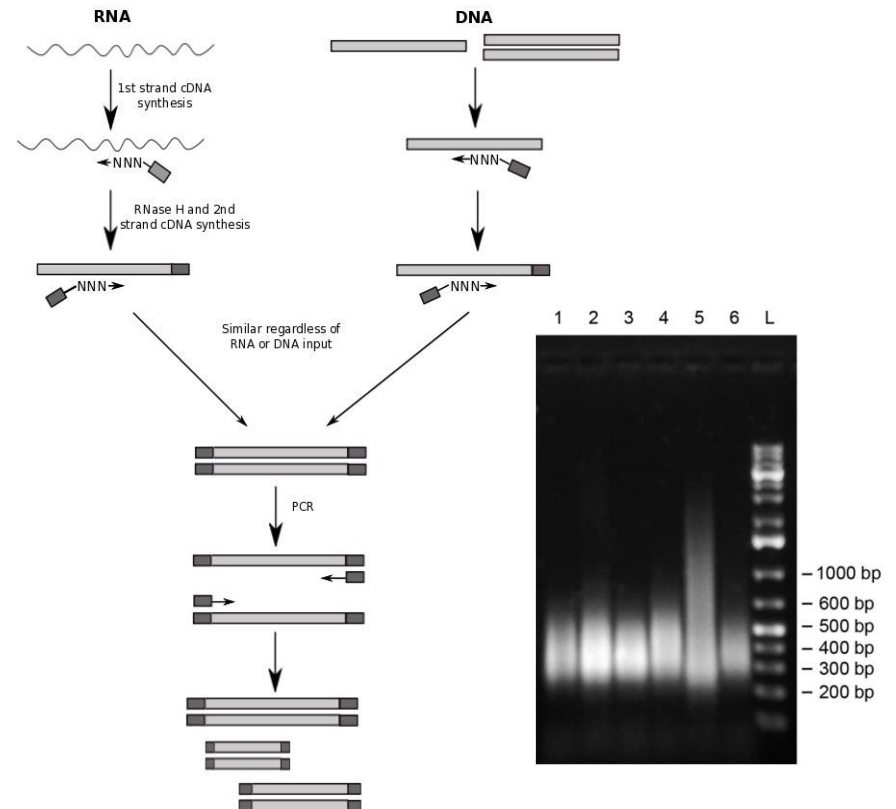

# 3. Pre-Amplification

- Targeted amplification (Amplicon)
- Random amplification

## MDA (multiple displacement amplification) by *Phi29* DNA polymerase

## Sequence-independent, single-primer amplification (SISPA)

# 4 & 5. Library Preparation & Sequencing

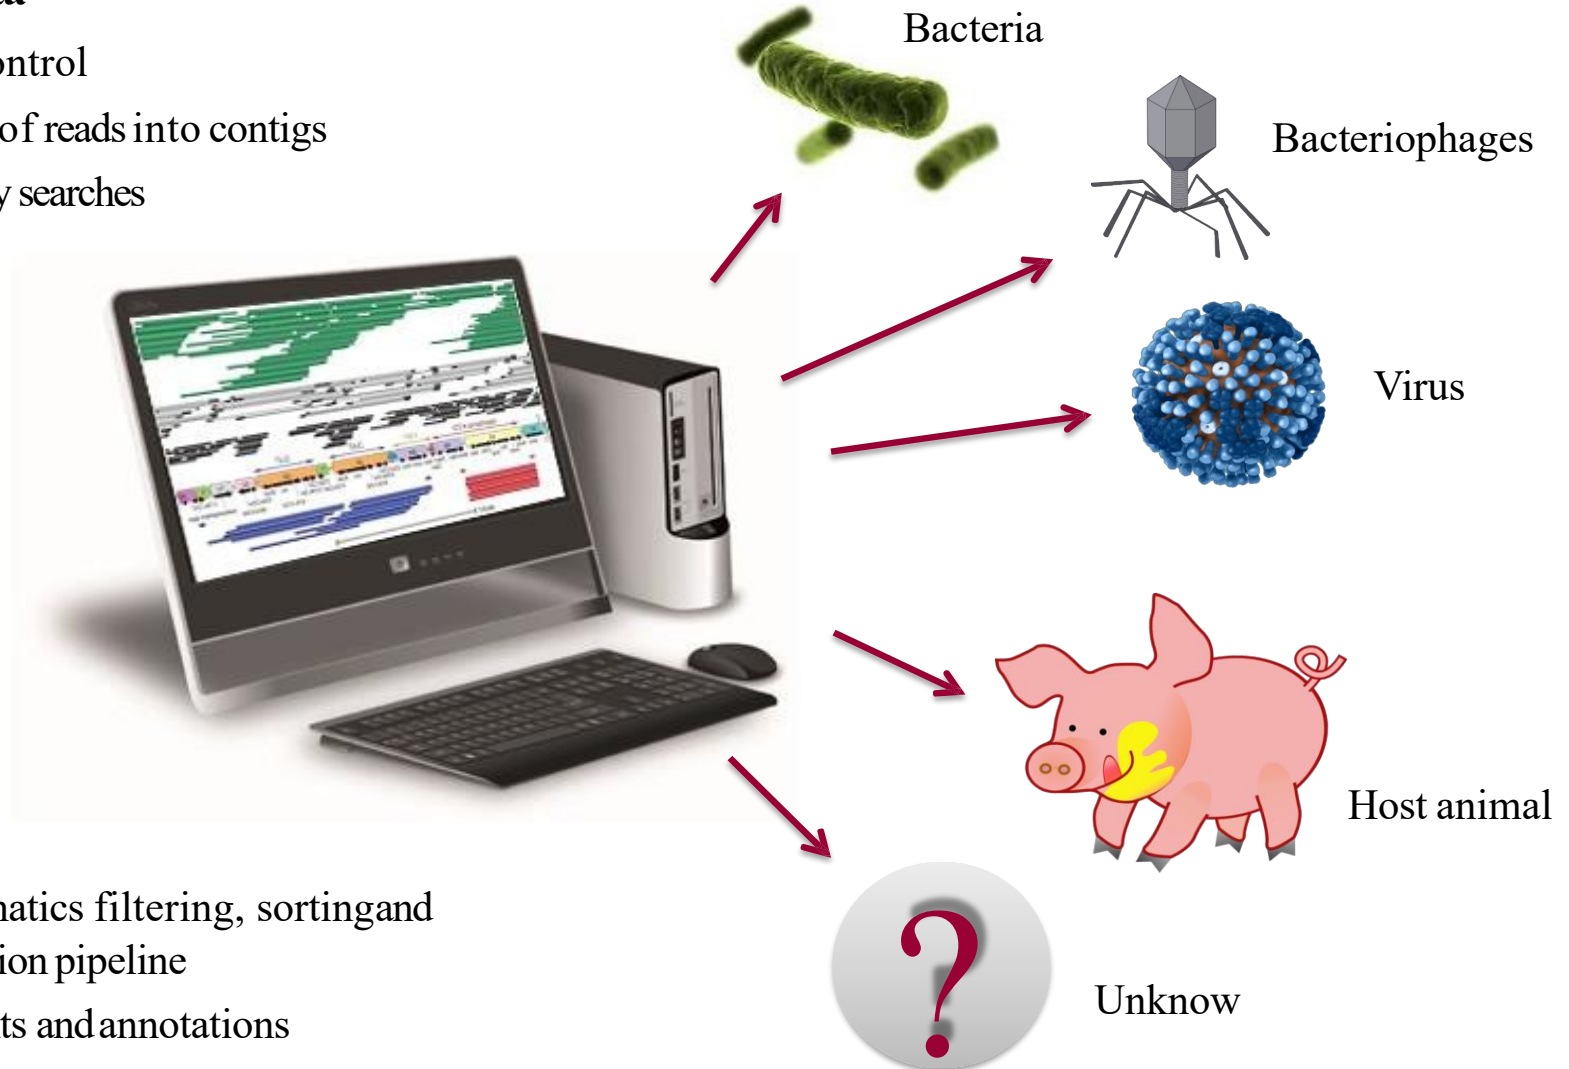

Smaller bench-top sequencer	Capacity/Time	Full size sequencer	Capacity/Time
<p>MiSeq</p>  <p>Illumina</p>	<p>~6 Gb (2 x 300)</p> <p>36 hours</p>	<p>HiSeq</p>  <p>Illumina</p>	<p>~600 Gb (2 x 100)</p> <p>11 days</p>

Mb = mega base pairs: 1,000,000 bp; Gb = giga base pairs: 1,000,000,000 bp

# 6. Bioinformatics & Computational Genomics

## Sequence data

- Quality control
- Assembly of reads into contigs
- Homology searches

- Bioinformatics filtering, sorting and classification pipeline
- Alignments and annotations

# **Illumina Sequencing by Synthesis (video)**

# HTS Applications

- Whole genome sequencing
- Whole exome sequencing
- RNA sequencing
- ChIP-seq/ChIP-exo
- CLIP-seq
- GRO-seq/PRO-seq
- Bisulfite-Seq
- .....

# Selected HTS Applications

# HTS application: whole genome sequencing

# The Whole Genome Sequencing (WGS) Process

WGS is a laboratory procedure that determines the order of bases in the genome of an organism in one process. WGS provides a very precise DNA fingerprint that can help link cases to one another allowing an outbreak to be detected and solved sooner.

## Bacterial Culture

1. DNA Extraction

- 1 Scientists take bacterial cells from an agar plate and treat them with chemicals that break them open, releasing the DNA. The DNA is then purified.

3. DNA Library Preparation

- 3 Scientists make many copies of each DNA fragment using a process called polymerase chain reaction (PCR). The pool of fragments generated in a PCR machine is called a "DNA library."

2. DNA Shearing

- 2 DNA is cut into short fragments of known length, either by using enzymes "molecular scissors" or mechanical disruption.

4. DNA Library Sequencing

- 4 The DNA library is loaded onto a sequencer. The combination of nucleotides (A, T, C, and G) making up each individual fragment of DNA is determined, and each result is called a "DNA read."

5. DNA Sequence Analysis

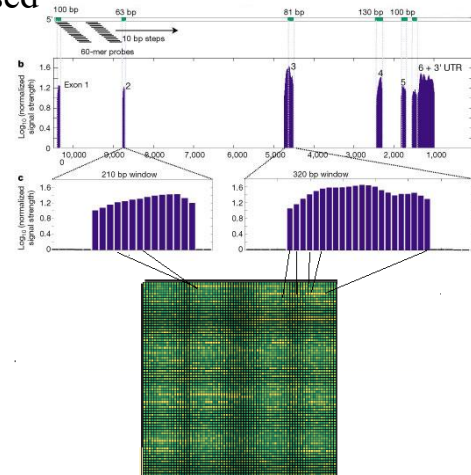

DNA Reads

Reconstructed Genome

- 5 The sequencer produces millions of DNA reads and specialized computer programs are used to put them together in the correct order like pieces of a jigsaw puzzle. When completed, the genome sequence containing millions of nucleotides (in one or a few large pieces) is ready for further analysis.

# HTS Application: RNAseq

## The evolution of transcriptomics

Nature Reviews | Genetics

**1995** P. Brown, et. al.  
Gene expression profiling  
using spotted cDNA microarray:  
expression levels of known genes

**2002** Affymetrix, whole genome  
expression profiling using tiling  
array: identifying and profiling  
novel genes and splicing variants

**2008** many groups, mRNA-seq:  
direct sequencing of mRNAs using  
next generation sequencing  
techniques (NGS)

RNA-seq is still a technology under  
active development

# How RNA-seq works

Sample preparation

Next generation sequencing (NGS)

Data analysis:

- ✓ Mapping reads
- ✓ Visualization
- ✓ De novo assembly
- ✓ Quantification

# RNA-seq Application

- Differential expression
- Gene fusion
- Alternative splicing
- Novel transcribed regions
- Allele-specific expression
- RNA editing
- Transcriptome for non-model organisms

# **Benefits & Challenges of RNA-seq**

## **Benefits:**

- Independence on prior knowledge
- High resolution, sensitivity and large dynamic range
- Unravel previously inaccessible complexities

## **Challenges:**

- Interpretation is not straightforward
- Procedures continue to evolve

# ChIP-seq is Key to Epigenome Mapping

- Binding site identification and discovery of binding sequence motifs (Non-histone ChIP)
- Epigenomic gene regulation and chromatin structure (Histone ChIP)

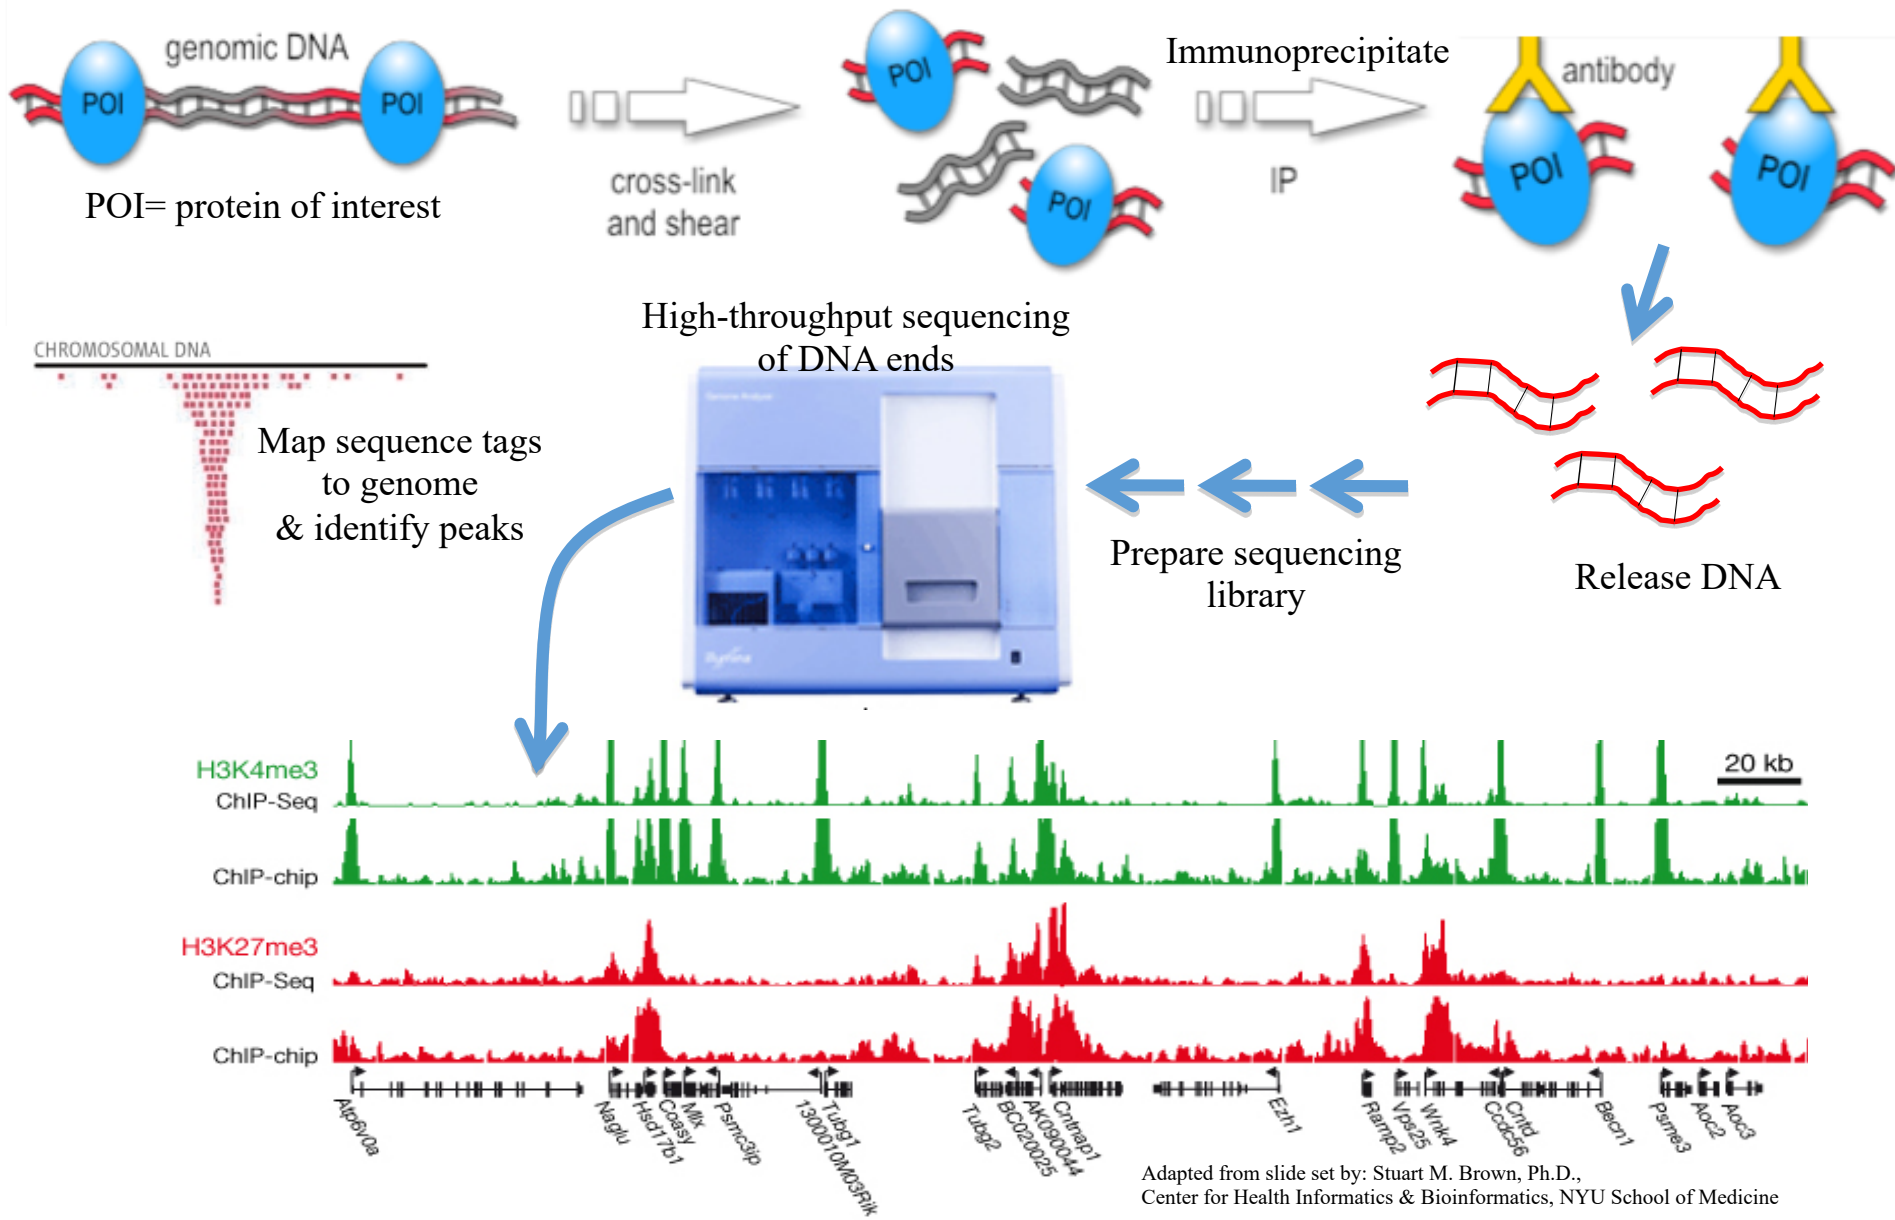

- **Transcription Factors**

- Where are they?
- Sequence preference
- Correlation with gene expression

- **Chromatin Marks**

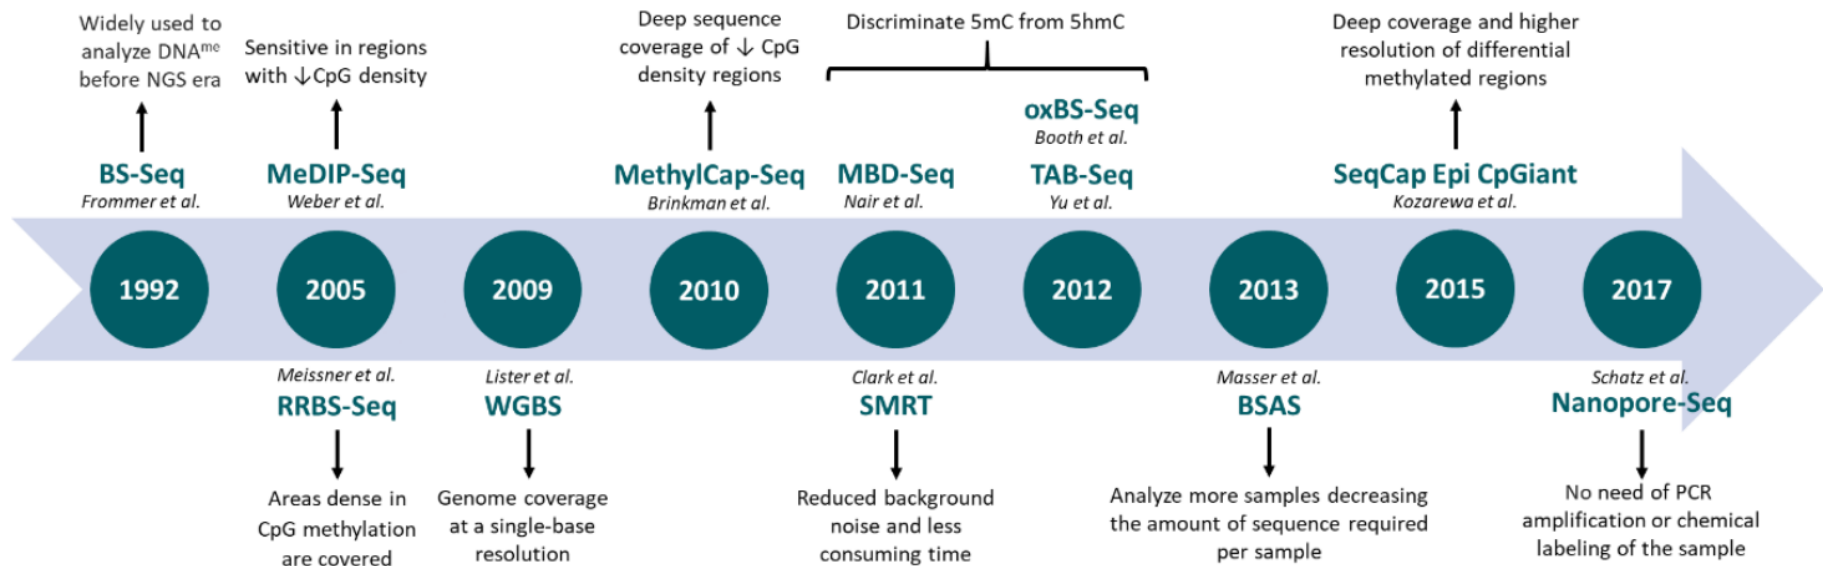

- Where are they?
- What combinations do they come in
- How do they relate to biological status

# Basic ChIP-Seq Workflow

# DNA Methylation Profiling (Methylome) by HTS

BS-Seq: bisulfite sequencing;

MeDIP-Seq: methylated DNA immunoprecipitation sequencing;

RRBS-Seq: reduced representation bisulfite sequencing;

WGBS: whole genome bisulfite sequencing;

MethylCap-Seq: methylation capture sequencing;

MBD-Seq: methyl-CpG binding domain sequencing;

oxBS-Seq: oxidative bisulfite sequencing;

TAB-Seq: TET-associated bisulfite sequencing;

BSAS: bisulfite amplicon sequencing

# Bisulfite-seq for Methylome Study

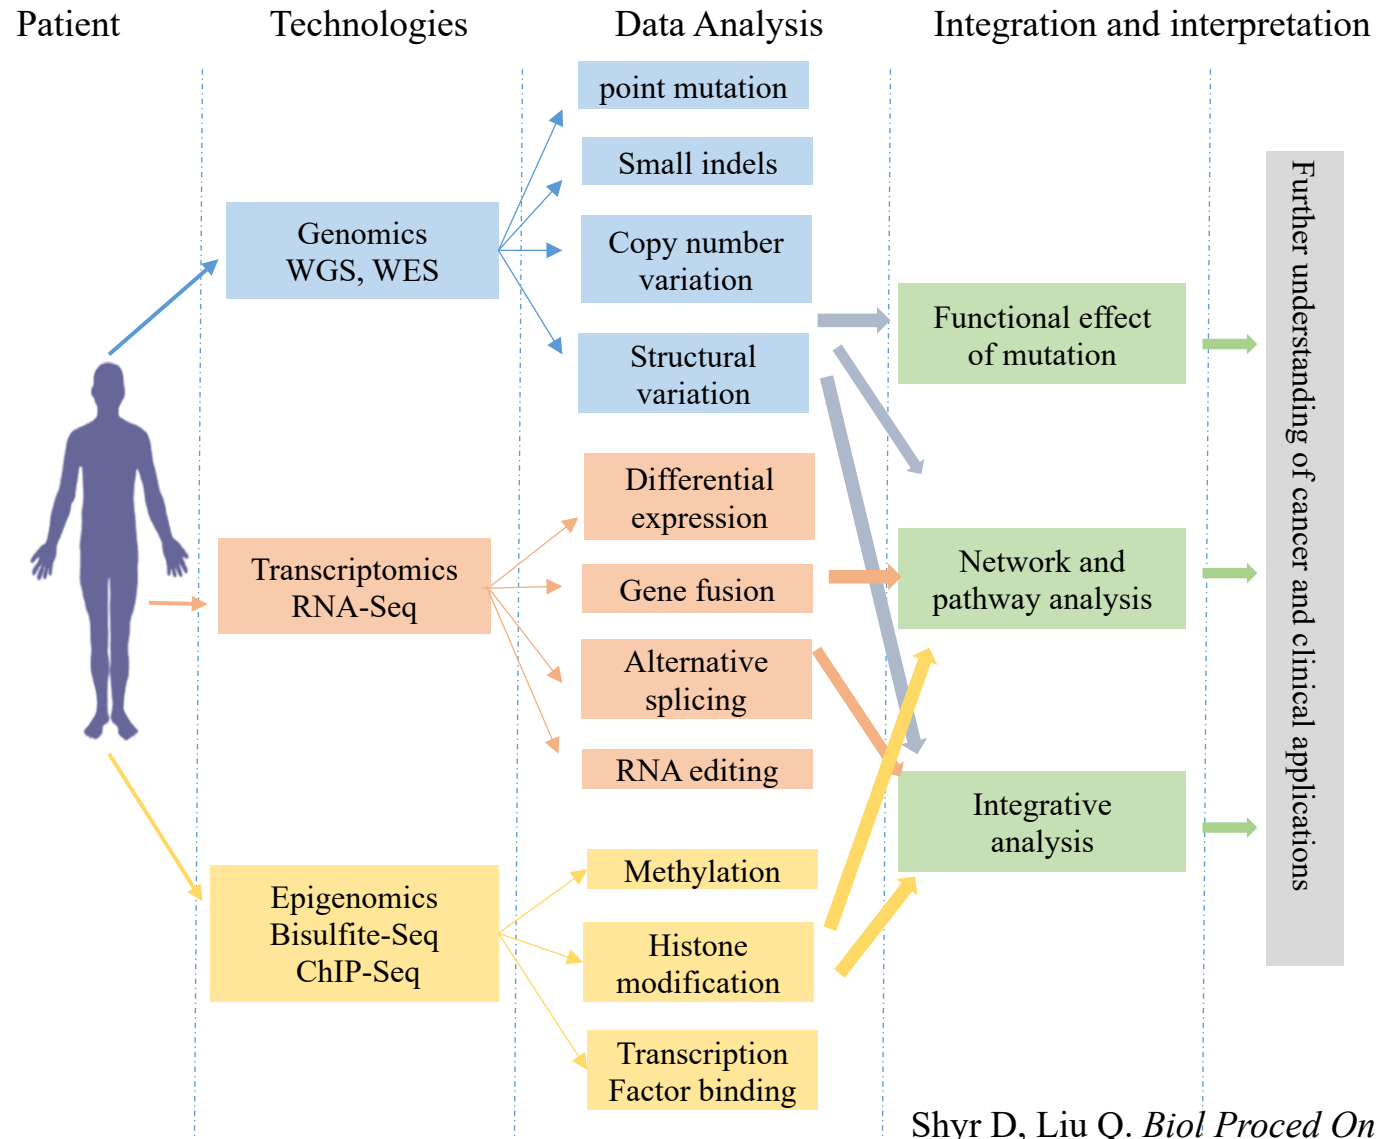

Sequencing: unmethylated cytosines read as thymidine in sense strand; adenine in the anti-sense strand. Other technologies evolved from here.

# HTS Advances Human (Epi)Genome Project

- Human Genome Project (1990-2003)
  - Sequenced all ~20,000 genes in our DNA
  - 3 billion basepairs, ~3 billion dollars
  - Only 1.5% of genome codes for proteins!
- Epigenomics Road Map (2008-Present)
  - Goal: Create map of epigenome in multiple tissue types and cancers

# **Application of HTS in Clinic**

- Genomic testing
- Precision medicine

# GENETICS VS. GENOMICS

## GENETICS

- **Genetics** is the study of heredity.
- "Gene" refers to a specific sequence of DNA on a single chromosome.
- Genetics involves the study of functions and composition of the single gene.

## GENOMICS

- **Genomics** is the study of the entirety of an organism's genes.
- "Genome" refers to an organism's entire genetic makeup.
- Genomics addresses all genes and their inter relationships.

Unlike genetics, genomics is not constrained to inheritable mutations. It identifies how your genetic makeup influences the course of a disease and, conversely, how environment, lifestyle, and drug treatments can trigger mutations that alter that course.

By understanding these ever-changing variables, doctors can make more informed choices in treatment, often preemptively.

# Applications of Genomic Testing in Medicine

**Transplant Medicine**

**Microbiology**

**Inherited Disease**

**Cancer**

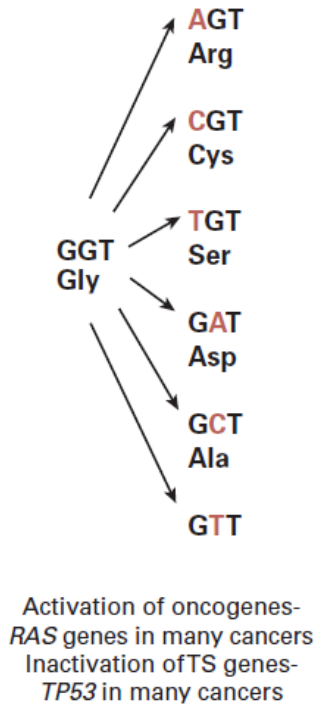

**Reproductive Health**

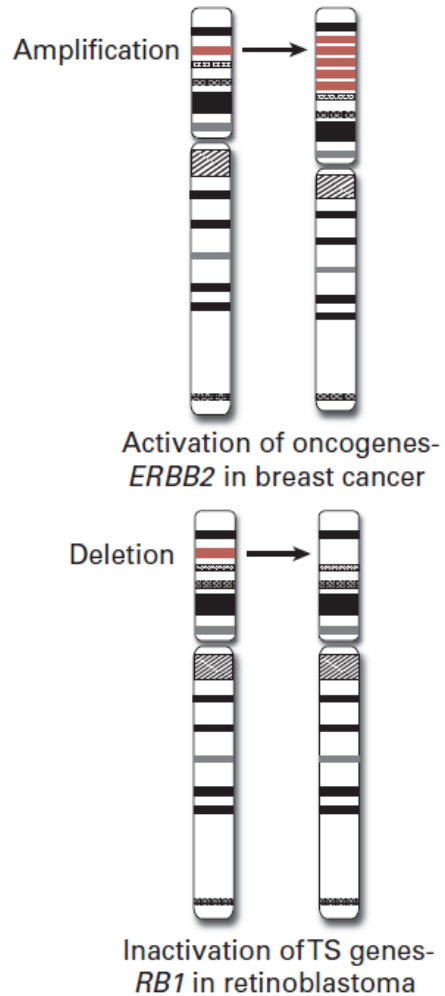

# Genomic Alterations in Cancer

## Major classes

### Point mutations

### Copy number alterations

### Translocations

Discovering unique therapies that treat an individual's cancer based on the specific genetic abnormalities of that person's tumor.

# HTS Application in Clinics: NIPT (Non-invasive Prenatal Testing)

**Prof. Dennis Lo, CUHK**

# 無創產檢獲獎 港教授與霍金齊名

【本報訊】十五年前率先發現孕婦血漿存有胎兒DNA，推出無創產前診斷技術的中文大學醫學院教授盧煜明，科研貢獻揚威海外，獲美國權威組織頒發「傑出研究獎」，是首名華人獲此殊榮。盧教授昨稱能將科學發現變成臨床測試，令人鼓舞，望港府及慈善團體增加撥款及捐助，繼續推動本港科研。

## 免流產風險測遺傳病

盧煜明為中大醫學院講座教授兼化學病理學系系主任，研究成果蜚聲國際。美國臨床化學協會和美國國家臨床生物化學學院本月中在洛杉磯向盧頒發傑出研究獎，過去曾有兩名諾貝爾得獎者獲獎。盧去年七月已獲英國皇家學會院士名銜，與光纖之父高錕、著名物理

學家霍金等齊名。

盧煜明與科研團隊在九七年率先發現孕婦血漿存有胎兒DNA，一改醫學界認為母體與胎兒血液不相連的說法。一〇年再突破，成功破解胎兒基因圖譜，有助及早發現是否先天性遺傳病。他推出名為「敏兒安 T21」無創產前診斷技術，診斷唐氏綜合症準確度達百分之九十九點一，免卻高危孕婦接受抽羊胎水或絨毛的入侵性檢查，毋須面對百分之〇點五至百分之一的流產風險。

中大醫學院為技術申請多項專利，授權本港私家醫院或診所搜集孕婦血液樣本測試。但盧早前公開批評有內地機構涉嫌侵權，使用同一技術檢測。盧教授昨表示，中大醫學院仍要諮詢法律意見是否追究涉嫌侵權事件。

●盧煜明成功破解胎兒基因圖譜，為產前檢查技術領域的重要突破。

## Noninvasive prenatal diagnosis of fetal chromosomal aneuploidy by massively parallel genomic sequencing of DNA in maternal plasma

# HTS Application in Oncology

## Cancer diagnosis

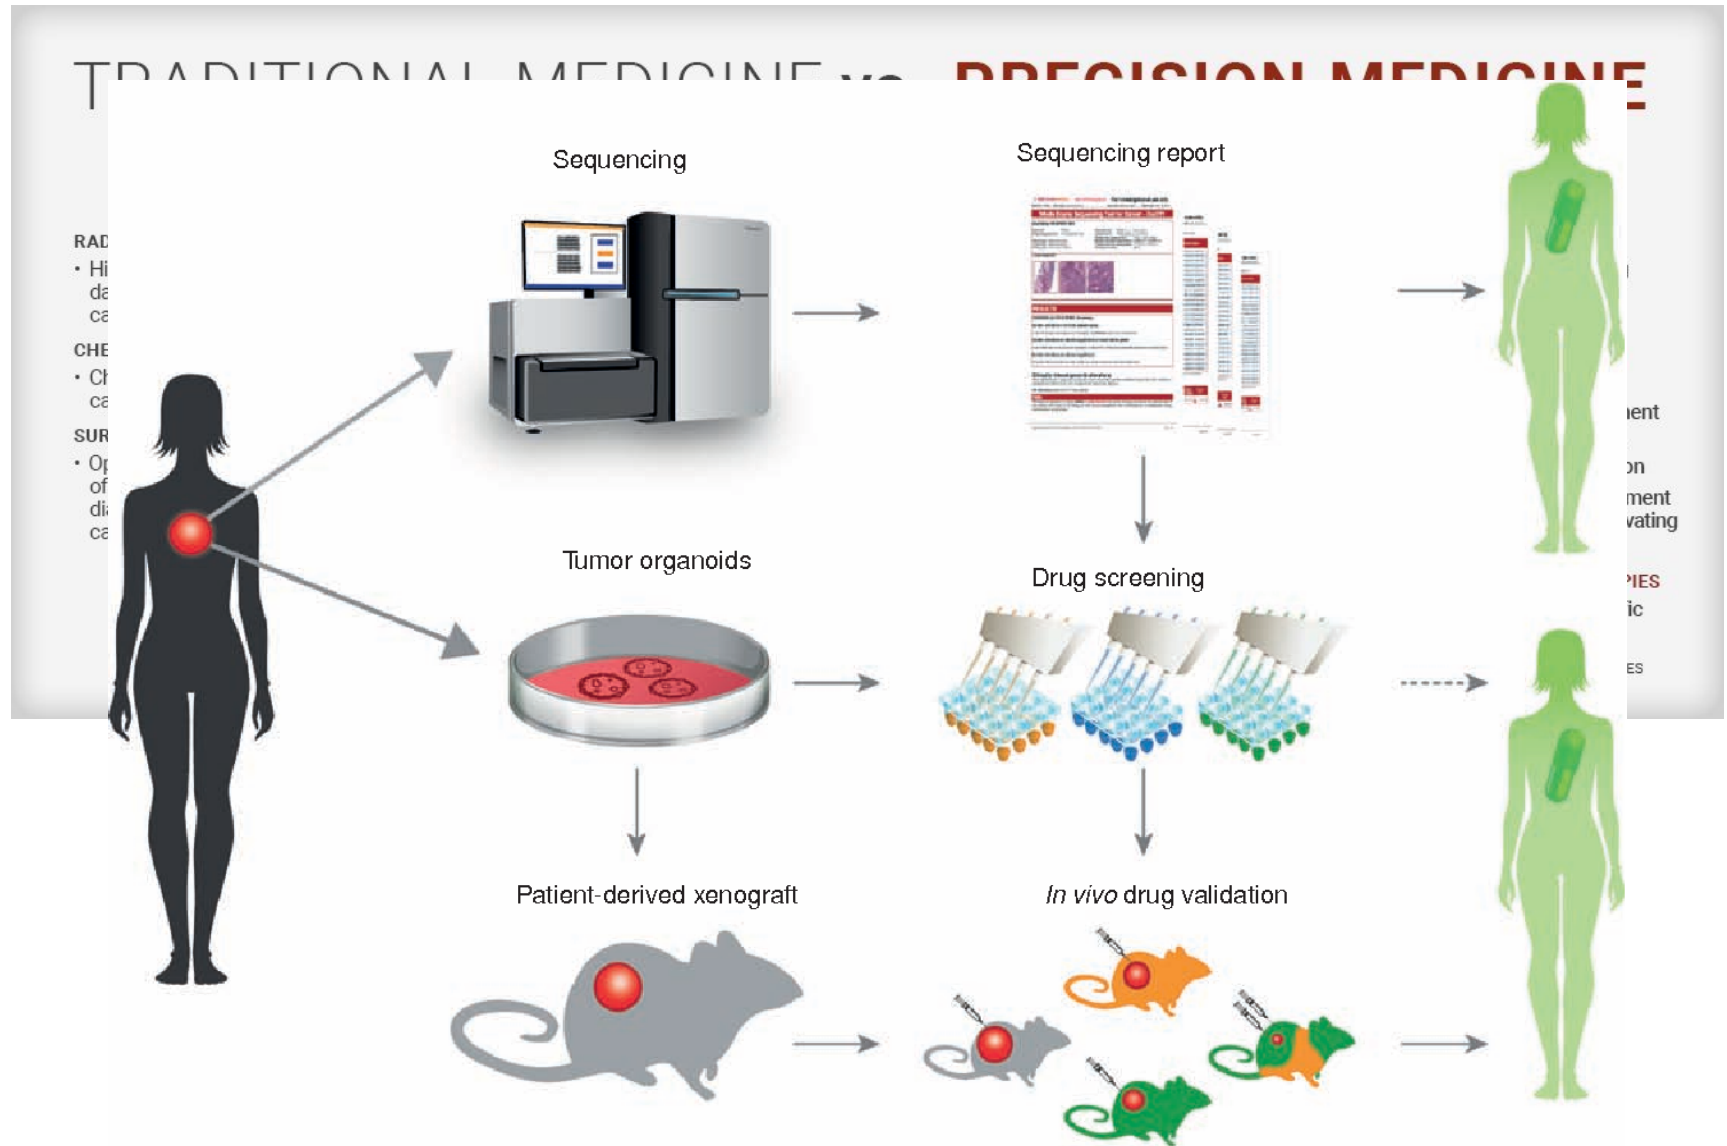

- Biopsy or sample removed during surgery can help identify the precise genetic origin.
- Liquid biopsies—samples of blood or urine—from which cell-free DNA (cfDNA) is isolated, avoiding the need for invasive procedures.

## Cancer screening

- For people at higher risk of cancer, genetic testing for cancer predisposition can play an important role in reducing cancer mortality through prevention.
- For people with a family history of these cancers, NGS-based testing is well-suited to identifying any inherited harmful variants

# HTS and Precision Medicine

**Figure 2.** Personalized models to guide precision medicine in advanced cancer. Illustration of our precision medicine program depicting the workflow,

# HTS Application in Mendelian Diseases-Genomic Testing

- Originate from single-gene variants, for example single nucleotide polymorphisms (SNPs) and indels, that parents can pass on to their offspring, and can be dominant or recessive in nature.
- HTS can be used to efficiently analyze multiple genes simultaneously, making it well-suited to searching for rare variants in a pool of many genes.
- HTS reduces the time to find the cause of a condition, contributing substantially to the well-being of patients and their relatives

Angelina Jolie tested  
positive for BRCA gene.

# Old techniques for genetic testing

- Karyotyping
- FISH
- PCR
- Array Comparative Genomic Hybridisation (aCGH)

# Polymerase chain reaction (PCR)

- Amplify specific DNA and RNA fragments
- Once nucleotide sequence of a region of DNA strand is known, complimentary oligonucleotides & polymerase are added to single strand DNA
- Repeat process 30 times to get adequate DNA
- PCR identify specific DNA sequence for gene mutation.

Visualization of the DNA

## Gel electrophoresis

a method for separation and analysis of macromolecules (DNA, RNA and proteins) and their fragments, based on their size and charge.

# Huntington gene

Encodes a run of 11-34 glutamine amino acid residues in the HD protein. A run of > 34 glutamine residues causes the protein to aggregate in the brain cells and cause progressive cell death.

The data below shows the results of electrophoresis of PCR fragments amplified using probes for the site which has been shown to be altered in Huntington's disease. The male parent, as shown by the black box, got Huntington's disease when he was 40 years old. His children include 6 (3,5,7,8,10,11) with Huntington's disease, and the age at which the symptoms first began is shown by the number above the band from the PCR fragment.

## Quiz:

- No relationship between age of onset of disease and the migration rate of PCR fragments.
- A shorter PCR fragment predicts early onset of Huntington's disease.
- Increased length of the amplified PCR fragment predicts early onset of Huntington's disease.
- Huntington's disease must be contagious since many of the children have the disease.

BRCA1 and BRCA2 (breast cancer , early onset) are normally expressed in the cells of breast and other tissue, where they help repair damaged DNA or destroy cells if DNA cannot be repaired. They are involved in the repair of chromosomal damage with an important role in the error-free repair of DNA double-strand breaks.

# Banded karyotyping

- A karyotype is the number and appearance of chromosomes in the nucleus of a eukaryotic cell.
- Karyotypes describe the number of chromosomes, and what they look like under a light microscope.
  - Abnormal number of chromosomes
  - Large duplications and deletions
  - Balanced rearrangements (translocations, inversions)

G-banding is obtained with Giemsa stain following digestion of chromosomes with trypsin. It yields a series of lightly and darkly stained bands — the dark regions tend to be heterochromatic, late-replicating and AT rich. The light regions tend to be euchromatic, early-replicating and GC rich.

In normal diploid organisms, autosomal chromosomes are present in two copies.

Y
