

DFA Minimization, Pumping Lemma

CSCI 3130 Formal Languages and Automata Theory

Siu On CHAN

Chinese University of Hong Kong

Fall 2017

$L = \text{lang. of strings ending in } 111$

Can we do it in 3 states?

Even smaller DFA?

$L = \text{lang. of strings ending in } 111$

Intuitively, needs to remember number of ones recently read

We will show

$\epsilon, 1, 11, 111$ are pairwise distinguishable by L

In other words

$(\epsilon, 1), (\epsilon, 11), (\epsilon, 111), (1, 11), (1, 111), (11, 111)$
are all distinguishable by L

Then use this result from last lecture:

If strings x_1, \dots, x_n are pairwise distinguishable by L , any DFA accepting L must have at least n states

Recap: distinguishable strings

What do we mean by “1 and 11 are distinguishable”?

(x, y) are distinguishable by L if there is string z such that
 $xz \in L$ and $yz \notin L$ (or the other way round)

We saw from last lecture

If x and y are distinguishable by L , any DFA accepting L must reach
different states upon reading x and y

Distinguishable strings

Why are **1** and **11** distinguishable by L ?

$L = \text{lang. of strings ending in } 111$

Distinguishable strings

Why are **1** and **11** distinguishable by L ?

$L = \text{lang. of strings ending in } 111$

Take $z = 1$

$$11 \notin L \quad 111 \in L$$

More generally, why are 1^i and 1^j distinguishable by L ?

$$(0 \leq i < j \leq 3)$$

Take $z = 1^{3-j}$

$$1^i 1^{3-j} \notin L \quad 1^j 1^{3-j} \in L$$

$\epsilon, 1, 11, 111$ are pairwise distinguishable by L

Thus our 4-state DFA is **minimal**

DFA minimization

We now show how to turn any DFA for L into the **minimal DFA** for L

Minimal DFA and distinguishability

Distinguishable strings must be in different states
Indistinguishable strings may end up in the same state

DFA minimal \Leftrightarrow Every pair of distinct states is distinguishable

Distinguishable states

Two states q and r are distinguishable if

on the same continuation string $z = z_1 \dots z_k$,
one accepts, but the other rejects

Examples of distinguishable states

Which of the following pairs are distinguishable? by which string?

(q_0, q_3)

(q_1, q_3)

(q_2, q_3)

(q_1, q_2)

(q_0, q_2)

(q_0, q_1)

Examples of distinguishable states

Which of the following pairs are distinguishable? by which string?

- (q_0, q_3) distinguishable by ε
- (q_1, q_3) distinguishable by ε
- (q_2, q_3) distinguishable by ε
- (q_1, q_2) distinguishable by 0
- (q_0, q_2) distinguishable by 0
- (q_0, q_1) **indistinguishable**

Examples of distinguishable states

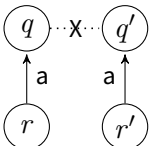

Which of the following pairs are distinguishable? by which string?

- (q_0, q_3) distinguishable by ε
- (q_1, q_3) distinguishable by ε
- (q_2, q_3) distinguishable by ε
- (q_1, q_2) distinguishable by 0
- (q_0, q_2) distinguishable by 0
- (q_0, q_1) **indistinguishable**

indistinguishable pairs
can be merged

Finding (in)distinguishable states

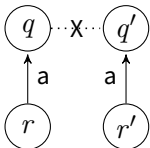

Phase 1:  If q is accepting and q' is rejecting
Mark (q, q') as distinguishable (X)

Phase 2:  If (q, q') are marked
Mark (r, r') as distinguishable (X)

Phase 3: Unmarked pairs are indistinguishable
Merge them into groups

Finding (in)distinguishable states

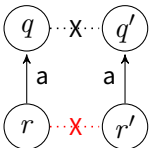

Phase 1:  If q is accepting and q' is rejecting
Mark (q, q') as distinguishable (X)

Phase 2:  If (q, q') are marked
Mark (r, r') as distinguishable (X)

Phase 3: Unmarked pairs are indistinguishable
Merge them into groups

Finding (in)distinguishable states

Phase 1:  If q is accepting and q' is rejecting
Mark (q, q') as distinguishable (X)

Phase 2:  If (q, q') are marked
Mark (r, r') as distinguishable (X)

Phase 3: Unmarked pairs are indistinguishable
Merge them into groups

DFA minimization: example

DFA minimization: example

q_0						
q_1						
q_{00}						
q_{01}						
q_{10}						
q_{11}	X	X	X	X	X	X
	q_ϵ	q_0	q_1	q_{00}	q_{01}	q_{10}

(Phase 1) q_{11} is distinguishable from all other states

DFA minimization: example

(Phase 2) Looking at $(r, r') = (q_\epsilon, q_0)$
Neither (q_0, q_{00}) nor (q_1, q_{01}) are distinguishable

DFA minimization: example

(Phase 2) Looking at $(r, r') = (q_\epsilon, q_1)$
 (q_1, q_{11}) is distinguishable

DFA minimization: example

q_0						
q_1	X	X				
q_{00}			X			
q_{01}	X	X		X		
q_{10}			X		X	
q_{11}	X	X	X	X	X	
	q_ϵ	q_0	q_1	q_{00}	q_{01}	q_{10}

(Phase 2) After going through the whole table **once**
Now we make **another pass**

DFA minimization: example

q_0						
q_1	X	X				
q_{00}			X			
q_{01}	X	X		X		
q_{10}			X		X	
q_{11}	X	X	X	X	X	
	q_ϵ	q_0	q_1	q_{00}	q_{01}	q_{10}

Blue arrows indicate transitions from q_0 to q_{00} (labeled 0) and from q_0 to q_{01} (labeled 1).

(Phase 2) Looking at $(r, r') = (q_\epsilon, q_0)$
Neither (q_0, q_{00}) nor (q_1, q_{01}) are distinguishable

DFA minimization: example

(Phase 2) Looking at $(r, r') = (q_\epsilon, q_{00})$
Neither (q_0, q_{00}) nor (q_1, q_{01}) are distinguishable

DFA minimization: example

q_0						
q_1	X	X				
q_{00}			X			
q_{01}	X	X		X		
q_{10}			X		X	
q_{11}	X	X	X	X	X	
	q_ϵ	q_0	q_1	q_{00}	q_{01}	q_{10}

(Phase 2) Nothing changes in the second pass
Ready to go to Phase 3

DFA minimization: example

q_0	A					
q_1	X	X				
q_{00}	A	A	X			
q_{01}	X	X	B	X		
q_{10}	A	A	X	A	X	
q_{11}	X	X	X	X	X	X
	q_ϵ	q_0	q_1	q_{00}	q_{01}	q_{10}

(Phase 3) Merge states into **groups** (also called **equivalence classes**)

DFA minimization: example

q_0	A					
q_1	X	X				
q_{00}	A	A	X			
q_{01}	X	X	B	X		
q_{10}	A	A	X	A	X	
q_{11}	X	X	X	X	X	X
	q_ϵ	q_0	q_1	q_{00}	q_{01}	q_{10}

Minimized DFA:

Why it works

Why have we found **all** distinguishable pairs?

Because we work **backwards**

Why it works

Why have we found **all** distinguishable pairs?

Because we work **backwards**

Why it works

Why have we found **all** distinguishable pairs?

Because we work **backwards**

Why it works

Why have we found **all** distinguishable pairs?

Because we work **backwards**

Pumping Lemma

Pumping lemma

Another way to show some language is irregular

Example

$L = \{0^n 1^n \mid n \geq 0\}$ is irregular

We reason by **contradiction**:

Suppose we have a DFA M for L

Something must be wrong with this DFA

M must accept some strings **outside** L

Towards a contradiction

What happens when M gets input $x = 0^{n+1}1^{n+1}$?

M accepts x because $x \in L$

Towards a contradiction

What happens when M gets input $x = 0^{n+1}1^{n+1}$?

M accepts x because $x \in L$

Since M has n states, it must **revisit** one of its states while reading 0^{n+1}

Towards a contradiction

What happens when M gets input $x = 0^{n+1}1^{n+1}$?

M accepts x because $x \in L$

Since M has n states, it must **revisit** one of its states while reading 0^{n+1}

The DFA must contain a **cycle** with 0s

Towards a contradiction

What happens when M gets input $x = 0^{n+1}1^{n+1}$?

M accepts x because $x \in L$

Since M has n states, it must **revisit** one of its states while reading 0^{n+1}

The DFA must contain a **cycle** with 0s

The DFA will also accept strings that go around the cycle **multiple times**

But such strings have more 0s than 1s and cannot be in L

Pumping lemma for regular languages

For every regular language L (say accepted by a DFA with n states)
for every string $s \in L$ longer than n symbols,
we can write $s = uvw$ where

1. $|uv| \leq n$
2. $|v| \geq 1$
3. For every $i \geq 0$, the string $uv^i w$ is in L

Proving languages are irregular

For every regular language L (say accepted by a DFA with n states)
for every string $s \in L$ longer than n symbols,
we can write $s = uvw$ where

1. $|uv| \leq n$
2. $|v| \geq 1$
3. For every $i \geq 0$, the string $uv^i w$ is in L

To show that a language L is irregular
we need to find arbitrarily long s

so that no matter how the lemma splits s into u, v, w (subject to

$$|uv| \leq n \text{ and } |v| \geq 1)$$

we can find $i \geq 0$ such that $uv^i w \notin L$

Example

$$L_2 = \{0^m 1^n \mid m > n \geq 0\}$$

1. For any n (number of states of an imaginary DFA accepting L_2)
2. There is a string $s = 0^{n+1} 1^n$
3. Pumping lemma splits s into uvw ($|uv| \leq n$ and $|v| \geq 1$)
4. Choose $i = 0$ so that $uv^i w \notin L_2$

Example: 00000011111
