

Eg 1: $X = C[0, 1]$, $d(x(t), y(t)) = \max_{t \in [0, 1]} |x(t) - y(t)|$, $\forall x(t), y(t) \in X$.

Show that (X, d) is a complete metric space.

Pf: ① (X, d) is a metric space.

1) It is clear that $d(x, y) \geq 0$ and $d(x, y) = 0$ iff $x = y$.

Moreover $d(x, y) = d(y, x)$

2) $\forall x, y, z \in X$, $\forall t \in [0, 1]$

$$|x(t) - y(t)| \leq |x(t) - z(t)| + |z(t) - y(t)|$$

Taking the maximum over $[0, 1]$, one has

$$d(x, y) \leq d(x, z) + d(z, y)$$

② Completeness

Let $\{x_n\} \subset X$ be an arbitrary Cauchy sequence, that is

$\forall \varepsilon > 0$, $\exists N \in \mathbb{N}$ s.t. for $m, n > N$

$$d(x_m, x_n) = \max_{t \in [0, 1]} |x_m(t) - x_n(t)| < \varepsilon \quad (*)$$

Then, $\forall t_* \in [0, 1]$, $|x_m(t_*) - x_n(t_*)| < \varepsilon$

which implies that $\{x_n(t_*)\}$ is Cauchy sequence in \mathbb{R} .

By the completeness of real numbers, $\exists x(t_*) \in \mathbb{R}$ s.t.

$$x_n(t_*) \rightarrow x(t_*) \text{ as } n \rightarrow +\infty.$$

Therefore, $\{x_n\}$ uniformly converge to $x(t)$. So $x(t)$ is continuous.

Now, it remains to show that $d(x_m, x) \rightarrow 0$ as $m \rightarrow \infty$.

Set $n \rightarrow \infty$ in $(*)$, one has

$$\max_{t \in [0, 1]} |x_m(t) - x(t)| \leq \varepsilon.$$

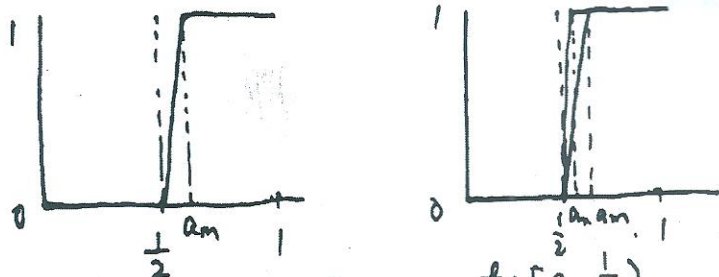

i.e., $d(x_m, x) \leq \varepsilon$

Ex 2. $X = C[0, 1]$, $d(x, y) = \int_0^1 |x(t) - y(t)| dt$, $\forall x, y \in X$.

Show that (X, d) is not completed.

PF: It is easy to check (X, d) is a metric space.

Now, we construct a Cauchy sequence as follows:

$$x_n(t) = \begin{cases} 0 & t \in [0, \frac{1}{2}] \\ n(t - \frac{1}{2}) & t \in [\frac{1}{2}, \frac{1}{2} + \frac{1}{n}] \\ 1 & t \in [\frac{1}{2} + \frac{1}{n}, 1] \end{cases}$$

Then $\forall \varepsilon > 0$,

$$d(x_m, x_n) = \int_0^1 |x_m - x_n| dt = \frac{1}{2} \left| \frac{1}{n} - \frac{1}{m} \right| < \varepsilon \text{ for } m, n > \frac{1}{\varepsilon}$$

So $\{x_n\}$ is a Cauchy sequence.

Now, $\forall x \in X$,

$$d(x_n, x) = \int_0^1 |x_n(t) - x(t)| dt = \int_0^{\frac{1}{2}} |x(t)| dt + \int_{\frac{1}{2}}^{\frac{1}{2} + \frac{1}{n}} |x_n(t) - x(t)| dt + \int_{\frac{1}{2} + \frac{1}{n}}^1 |1 - x(t)| dt$$

Then $d(x_n, x) \rightarrow 0$ as $n \rightarrow \infty$ yields that

$$0 = \int_0^{\frac{1}{2}} |x(t)| dt = \int_{\frac{1}{2}}^1 |1 - x(t)| dt$$

$$\text{i.e. } x(t) = \begin{cases} 0 & t \in (0, \frac{1}{2}) \\ 1 & t \in (\frac{1}{2}, 1). \end{cases}$$

Therefore $x(t)$ is impossible continuous!

That is the Cauchy sequence is not convergent.
