

Math 2010 Week 2 (Au 1.3)

Linear Objects in \mathbb{R}^n

e.g. lines, plane, k-plane, hyperplane

Line

e.g. in \mathbb{R}^2

Equation form

$$2x + y = 2$$

Parametric form

$$\begin{aligned}(x, y) &= \overrightarrow{OA} + t \overrightarrow{AB} \\ &= (1, 0) + t(-1, 2) \\ &= (1-t, 2t)\end{aligned}$$

Varying $t \in \mathbb{R}$ gives all the points on L

Note that

$$\begin{cases} x = 1-t \\ y = 2t \end{cases} \Rightarrow \begin{cases} t = \frac{x-1}{-1} \\ t = \frac{y}{2} \end{cases} \Rightarrow \frac{x-1}{-1} = \frac{y}{2}$$

Symmetric / Slope form

Parametric form of a line in \mathbb{R}^n

let L be a line in \mathbb{R}^n

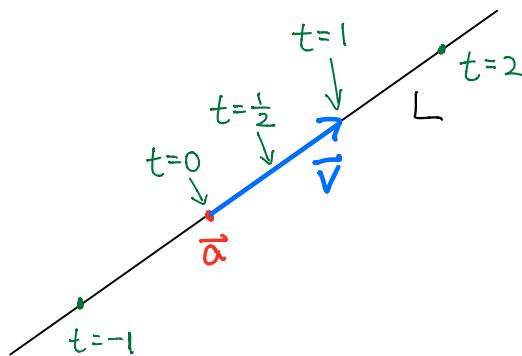

\vec{a} is a point on L

\vec{v} is a direction vector of L

Parametric form of L

$$\vec{x} = \vec{a} + t \vec{v}$$

$t \in \mathbb{R}$ is called a parameter

L is parametrized by $t \in \mathbb{R}$

Eg A line L in \mathbb{R}^3 passes through

$$A = (1, 2, 3), B = (-1, 3, 5).$$

Then we can take $\vec{a} = (1, 2, 3)$,

$$\vec{v} = \overrightarrow{AB} = (-1-1, 3-2, 5-3) = (-2, 1, 2)$$

\therefore Parametric form:

$$(x, y, z) = (1, 2, 3) + t(-2, 1, 2) \quad \textcircled{*}$$

Rmk ① Parametric form is not unique.

Other parametrizations of L

$$(x, y, z) = (-1, 3, 5) + t(2, -1, -2)$$

$$\text{or } (-1, 3, 5) + t(-4, 2, 4)$$

② From $\textcircled{*}$, we get symmetric form

$$\frac{x-1}{-2} = \frac{y-2}{1} = \frac{z-3}{2} \quad (=t)$$

$$\Leftrightarrow \begin{cases} x-1 = -2(y-2) \\ x-1 = -(z-3) \end{cases}$$

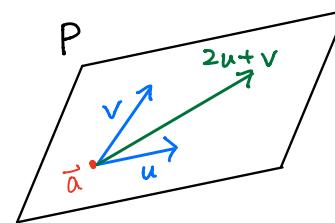

Planes in \mathbb{R}^3

A plane P in \mathbb{R}^3 can be determined by

- ① 3 non-collinear points on P ; or
- ② A point on P and 2 linearly independent directions (not same or opposite); or
- ③ A point on P and a normal vector

For ②

Let $\vec{a} \in P$, \vec{u}, \vec{v} are lin. indept directions of P

Parametric form of P

$$\vec{x} = \vec{a} + s\vec{u} + t\vec{v}$$

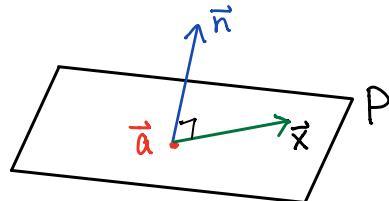

a point on P

parameters

directions

For ③, suppose

- $\vec{a} = (a_1, a_2, a_3)$ is a point on P
- $\vec{n} = (n_1, n_2, n_3)$ is a normal vector of P

Let $\vec{x} = (x, y, z) \in \mathbb{R}^3$. Then

$$\begin{aligned}\vec{x} \text{ is on } P &\Leftrightarrow \vec{x} - \vec{a} \perp \vec{n} \\ &\Leftrightarrow (\vec{x} - \vec{a}) \cdot \vec{n} = 0 \\ &\Leftrightarrow \vec{x} \cdot \vec{n} = \vec{a} \cdot \vec{n}\end{aligned}$$

Equation of P

$$n_1x + n_2y + n_3z = a_1n_1 + a_2n_2 + a_3n_3$$

Rmk If $(a, b, c) \neq \vec{0}$, the equation

$$ax + by + cz = d$$

describes a plane in \mathbb{R}^3 with normal vector (a, b, c) .

e.g Suppose P is a plane passing through

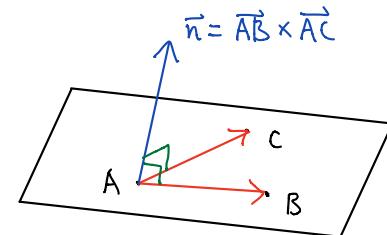

$$A = (0, 0, 1), B = (0, 2, 0), C = (-1, 1, 0)$$

Represent P using (i) parametric form ; (ii) equation

Sol (i)

$$\begin{aligned}\overrightarrow{AB} &= (0, 2, 0) - (0, 0, 1) \\ &= (0, 2, -1)\end{aligned}$$

$$\begin{aligned}\overrightarrow{AC} &= (-1, 1, 0) - (0, 0, 1) \\ &= (-1, 1, -1)\end{aligned}$$

∴ Parametric form:

$$(x, y, z) = (0, 0, 1) + s(0, 2, -1) + t(-1, 1, -1)$$

(ii) Take $\vec{n} = \overrightarrow{AB} \times \overrightarrow{AC} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 0 & 2 & -1 \\ -1 & 1 & -1 \end{vmatrix} = (-1, 1, 2) \perp P$

∴ Equation for P :

$$[(x, y, z) - (0, 0, 1)] \cdot (-1, 1, 2) = 0$$

$$(-1)x + (1)y + 2(z - 1) = 0$$

$$-x + y + 2z = 2$$

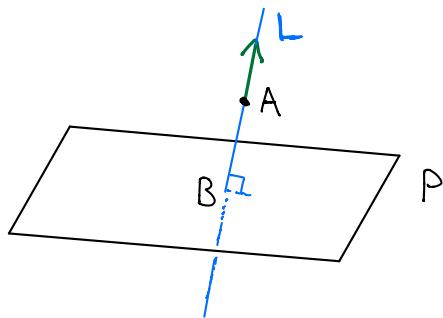

Ex Find the distance between $A = (2, 1, 1)$ and the plane $P: -x + 2y - z = -4$ *

Sol From *, $\vec{n} = (-1, 2, -1) \perp P$

Consider the line L

$$\vec{x}(t) = \vec{A} + t\vec{n} = (2, 1, 1) + t(-1, 2, -1)$$

Let $B = L \cap P$ be the intersection of L and P

Then B is the point on P closest to A

To find B , put

$$\vec{x}(t) = (2-t, 1+2t, 1-t) \text{ into } *$$

$$\text{Then } -(2-t) + 2(1+2t) - (1-t) = -4$$

$$\Rightarrow 6t - 1 = -4 \Rightarrow 6t = -3 \Rightarrow t = -\frac{1}{2}$$

$$\therefore B = \vec{x}\left(-\frac{1}{2}\right) = \left(\frac{5}{2}, 0, \frac{3}{2}\right)$$

Distance between A and P

$$\begin{aligned} &= \|\overrightarrow{AB}\| = \sqrt{\left(\frac{5}{2} - 2\right)^2 + (0 - 1)^2 + \left(\frac{3}{2} - 1\right)^2} \\ &= \frac{\sqrt{6}}{2} \end{aligned}$$

Ex Find the distance between the lines

$$L_1(s) = (-4, 9, -4) + s(4, -3, 0)$$

$$L_2(t) = (5, 2, 10) + t(4, 3, 2)$$

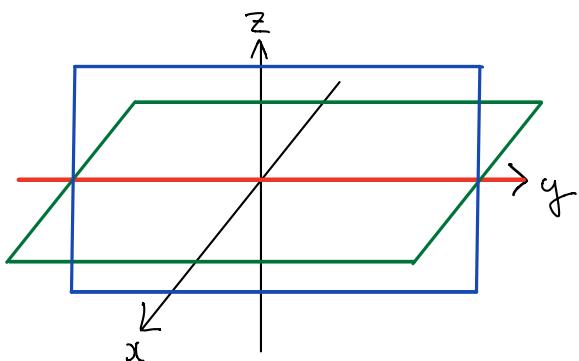

Hint: Find A on L_1 , B on L_2 such that

$$\overrightarrow{AB} \perp L_1, L_2$$

(Ans: 13)

Line in \mathbb{R}^3 by equations

e.g 1 y -axis in \mathbb{R}^3

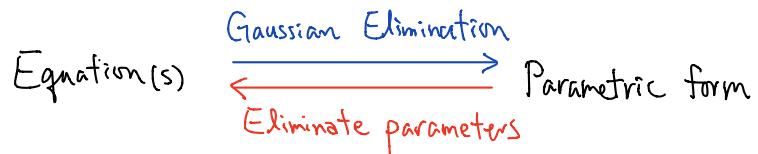

One equation can only represent a plane.
We need at least two to represent a line.

e.g. $\begin{cases} x = 0 \\ z = 0 \end{cases} \leftrightarrow y\text{-axis}$

System of equations \leftrightarrow Intersection of planes

Two ways to represent linear objects

e.g 2

Given equations of a line L

$$\begin{cases} x + y + 6z = 6 \\ x - y - 2z = -2 \end{cases} \rightarrow \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 2 \\ 4 \\ 0 \end{bmatrix} + t \begin{bmatrix} -2 \\ -4 \\ 1 \end{bmatrix}$$

Conversely, from \otimes

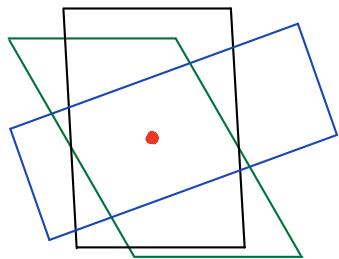

$$\begin{aligned} x &= 2 - 2t \\ y &= 4 - 4t \\ z &= t \end{aligned} \Rightarrow \begin{aligned} 2x - y &= 0 \\ y &= 4 - 4z \Rightarrow y + 4z &= 4 \end{aligned}$$

\therefore Another set of equations for L: $\begin{cases} 2x - y = 0 \\ y + 4z = 4 \end{cases}$

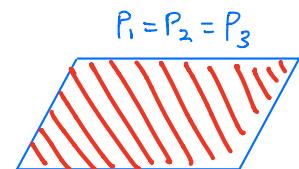

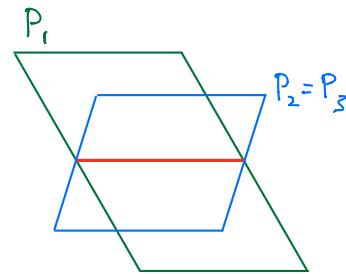

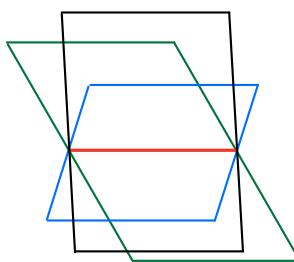

eg 3 Three non-trivial equations of the form $ax+by+cz=d$ (in \mathbb{R}^3)
means $(a,b,c) \neq (0,0,0)$

Pictures

Case 1: Unique solution

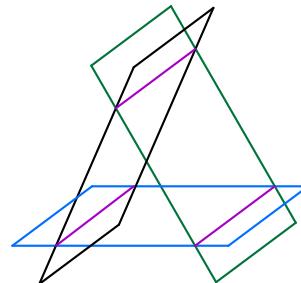

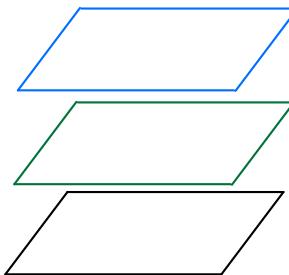

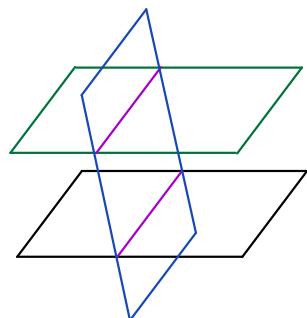

Case 2: Infinitely many solutions

Case 3: No solution \leftrightarrow No common intersection

eg

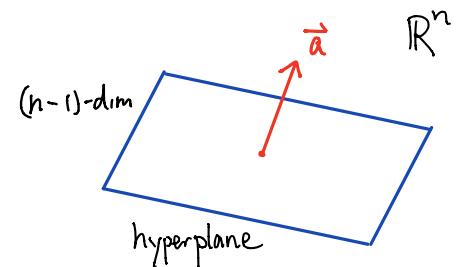

General linear objects in \mathbb{R}^n

- Similar to lines in \mathbb{R}^3 , we need a system of equations to describe a plane in \mathbb{R}^n
- In \mathbb{R}^n , an equation of the form

$$\vec{a} \cdot \vec{x} = a_1x_1 + a_2x_2 + \dots + a_nx_n = c, \quad \vec{a} \neq \vec{0}$$

describes a hyperplane (dimension = $n-1$) with normal vector \vec{a}

- To describe a k -dimensional plane P (called k -plane) in \mathbb{R}^n :

Parametric form

$$\vec{x} = \vec{q} + \sum_{i=1}^k t_i \vec{v}_i, \text{ where}$$

- $\vec{q} \in P$
- $\vec{v}_1, \dots, \vec{v}_k$ are k lin. indept vectors $\parallel P$
- t_1, \dots, t_k are parameters

Equations

$$\begin{array}{l} \text{rank } A = n-k \\ \Leftrightarrow n-k \text{ non-redundant equations } (i=1, 2, \dots, n-k) \end{array}$$

$$\sum_{j=1}^n a_{ij} x_j = c_i$$

System of
 $n-k$ equations

Intersection of
 $n-k$ hyperplanes

Curves in \mathbb{R}^n (Au 2.1, 2.2, Thomas 11.1, 11.2)

Defn Let $I \subset \mathbb{R}$ be an interval

A curve in \mathbb{R}^n is a continuous function

$$\vec{x}: I \longrightarrow \mathbb{R}^n$$

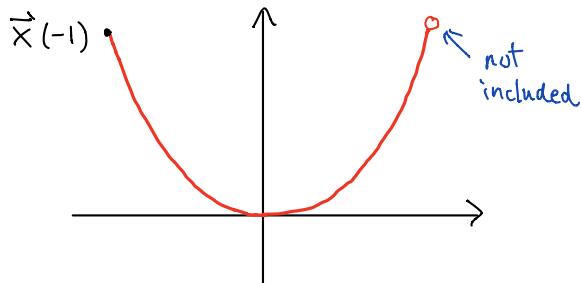

i.e. $\vec{x}(t) = (x_1(t), x_2(t), \dots, x_n(t))$ such that every component function $x_i(t)$ is continuous.

eg 1. $\vec{x}: [-1, 1] \longrightarrow \mathbb{R}^2$

$$\vec{x}(t) = (t, t^2) \Rightarrow x^2 = t^2 = y$$

" " " "

\therefore Parabola

eg 2 $\vec{x}: \mathbb{R} \rightarrow \mathbb{R}^3$, $\vec{p}, \vec{q} \in \mathbb{R}^3$, $\vec{q} \neq \vec{0}$

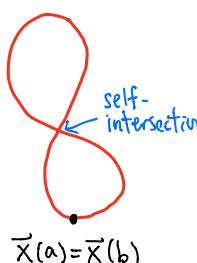

$$\vec{x}(t) = \vec{p} + t\vec{q} \quad (\text{a straight line})$$

Defn A curve $\vec{x}: [a, b] \rightarrow \mathbb{R}^n$ is said to be

- i. closed if $\vec{x}(a) = \vec{x}(b)$
- ii. simple if $\vec{x}(t_1) \neq \vec{x}(t_2)$ for any $a \leq t_1 < t_2 \leq b$, except possibly at $t_1 = a$, $t_2 = b$

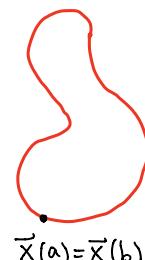

eg

Closed
not simple

Simple
not closed

Simple,
closed

Ihm Let $\vec{x}(t) = (x_1(t), x_2(t), \dots, x_n(t))$. Then

$$\textcircled{1} \quad \lim_{t \rightarrow a} \vec{x}(t) = \left(\lim_{t \rightarrow a} x_1(t), \dots, \lim_{t \rightarrow a} x_n(t) \right)$$

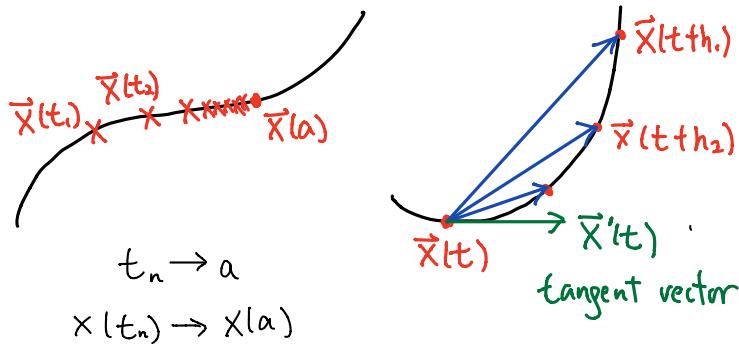

$$\textcircled{2} \quad \vec{x}'(t) \stackrel{\text{Defn}}{=} \lim_{h \rightarrow 0} \frac{\vec{x}(t+h) - \vec{x}(t)}{h}$$

$$= (x'_1(t), x'_2(t), \dots, x'_n(t))$$

provided the limits exist.

Rmk $\vec{x}'(a) = \text{tangent vector of } \vec{x}(t) \text{ at } t=a$.

Picture

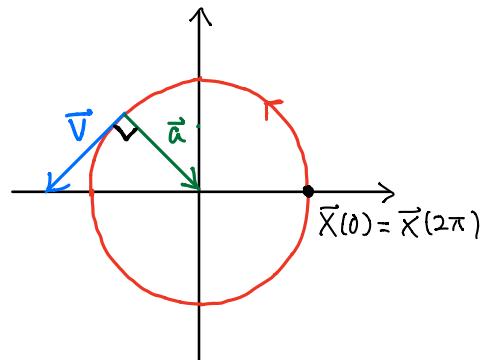

Physics

If $\vec{x}(t) = \text{displacement}$ at time t

Then $\vec{x}'(t) = \text{velocity} = \vec{v}(t)$

$\vec{x}''(t) = \text{acceleration} = \vec{a}(t)$

e.g. $\vec{x}(t) = (\cos t, \sin t) \quad 0 \leq t \leq 2\pi$

$$\vec{v}(t) = \vec{x}'(t) = (-\sin t, \cos t) \perp \vec{x}(t)$$

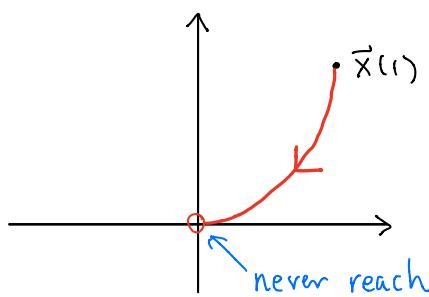

$$\vec{a}(t) = \vec{x}''(t) = (-\cos t, -\sin t) = -\vec{x}(t)$$

$$\text{Also speed} = \|\vec{v}(t)\| = 1$$

e.g. $\vec{x}: [1, \infty) \rightarrow \mathbb{R}^2$

$$\vec{x}(t) = \left(\frac{1}{t}, \frac{1}{t^2} \right)$$

$\stackrel{\text{"}}{x} \quad \stackrel{\text{"}}{y} \Rightarrow y = x^2$

$$\begin{aligned}\lim_{t \rightarrow \infty} \vec{x}(t) &= \left(\lim_{t \rightarrow \infty} \frac{1}{t}, \lim_{t \rightarrow \infty} \frac{1}{t^2} \right) \\ &= (0, 0)\end{aligned}$$

Rules

Let $\vec{x}(t), \vec{y}(t)$ be curves in \mathbb{R}^n , $c \in \mathbb{R}$ be a constant
 $f(t)$ be a real-valued function.

$$\textcircled{1} \quad (\vec{x}(t) \pm \vec{y}(t))' = \vec{x}'(t) \pm \vec{y}'(t)$$

$$\textcircled{2} \quad (c \vec{x}(t))' = c \vec{x}'(t)$$

$$\textcircled{3} \quad (f(t) \vec{x}(t))' = f'(t) \vec{x}(t) + f(t) \vec{x}'(t)$$

$$\textcircled{4} \quad (\vec{x}(t) \cdot \vec{y}(t))' = \vec{x}'(t) \cdot \vec{y}(t) + \vec{x}(t) \cdot \vec{y}'(t)$$

\textcircled{5} If $n=3$,

$$(\vec{x}(t) \times \vec{y}(t))' = \vec{x}'(t) \times \vec{y}(t) + \vec{x}(t) \times \vec{y}'(t)$$

Rmk \textcircled{3} - \textcircled{5} are product rules

Arclength

Let $\vec{x}(t)$ be a curve with $\vec{x}'(t)$ exists and continuous

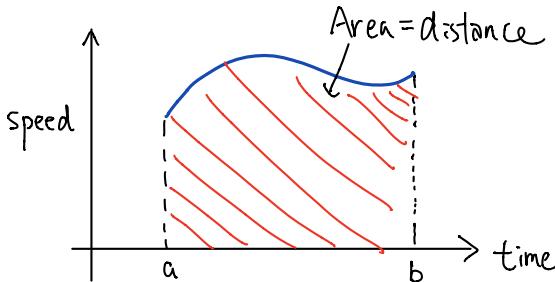

Arclength of $\vec{x}(t)$ for $a \leq t \leq b$ is

$$s = \int_a^b \|\vec{x}'(t)\| dt$$

If $\vec{x}(t)$ = displacement at time t
then $\vec{x}'(t)$ = velocity

$$\|\vec{x}'(t)\| = \text{speed}$$

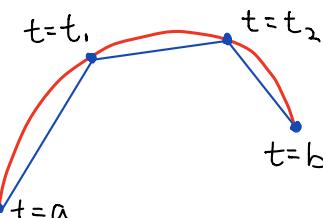

$$\int_a^b \|\vec{x}'(t)\| dt = \text{distance travelled}$$

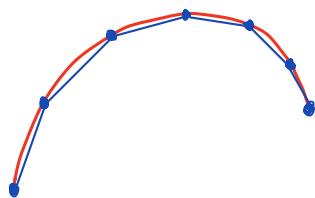

From Point of view of Mathematics

Approximate a curve by line segments:

Take $a = t_0 < t_1 < t_2 < \dots < t_n = b$

Approximation

Better approximation

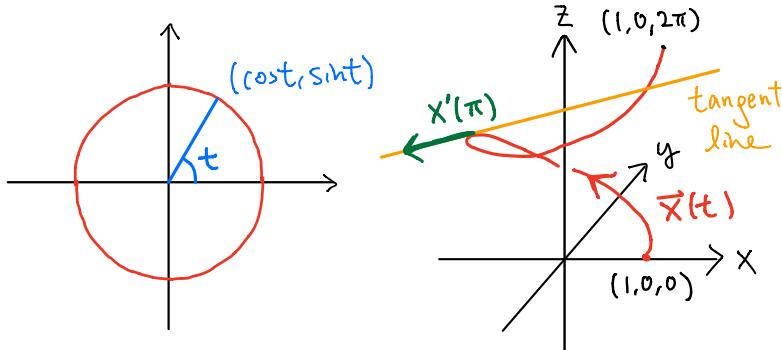

$$s \approx \sum_{i=1}^n \|\vec{x}(t_i) - \vec{x}(t_{i-1})\| \quad \left(\begin{array}{l} \text{Recall:} \\ \vec{x}'(t_i) = \lim_{t \rightarrow t_i} \frac{\vec{x}(t) - \vec{x}(t_i)}{t - t_i} \end{array} \right)$$

$$\approx \sum_{i=1}^n \|\vec{x}'(t_i)\| (t_i - t_{i-1})$$

$$\text{Take Limit } \Rightarrow s = \int_a^b \|\vec{x}'(t)\| dt$$

e.g (Helix)

$$\vec{x}(t) = (\cos t, \sin t, t), t \in [0, 2\pi]$$

a. Find the tangent line of \vec{x} at $t=\pi$.

b. Find arclength of the helix.

Sol

$$a. \vec{x}(t) = (\cos t, \sin t, t)$$

$$\vec{x}'(t) = (-\sin t, \cos t, 1)$$

$$\vec{x}'(\pi) = (0, -1, 1) \leftarrow \text{direction of tangent}$$

Also, $\vec{x}(\pi) = (-1, 0, \pi) \leftarrow$ a point on tangent line

\therefore Parametric form of tangent line

$$\vec{x} = (-1, 0, \pi) + t(0, -1, 1)$$

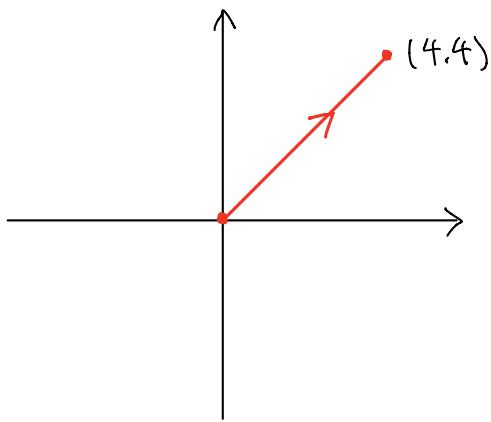

$$\begin{aligned} b. \quad \|\vec{x}'(t)\| &= \sqrt{(-\sin t)^2 + (\cos t)^2 + 1^2} \\ &= \sqrt{2} \end{aligned}$$

$$\begin{aligned} \Rightarrow S &= \int_0^{2\pi} \|\vec{x}'(t)\| dt \\ &= \int_0^{2\pi} \sqrt{2} dt \\ &= \left[\sqrt{2} t \right]_0^{2\pi} \\ &= 2\sqrt{2} \pi \end{aligned}$$

Arc length is independent of parametrization

e.g. $\vec{x}(t) = (t, t)$ $0 \leq t \leq 4$

$\vec{y}(t) = (t^2, t^2)$ $0 \leq t \leq 2$

\vec{x}, \vec{y} are two parametrizations
of the same line segment

$$\vec{x}'(t) = (1, 1)$$

$$\vec{y}'(t) = (2t, 2t)$$

arc length of $\vec{x}(t)$

$$= \int_0^4 \|\vec{x}'(t)\| dt$$

$$= \int_0^4 \sqrt{2} dt$$

$$= 4\sqrt{2}$$

arc length of $\vec{y}(t)$

$$= \int_0^2 \|\vec{y}'(t)\| dt$$

$$= \int_0^2 \sqrt{(2t)^2 + (2t)^2} dt$$

$$= \int_0^2 2\sqrt{2}t dt$$

$$= \left[\sqrt{2}t^2 \right]_0$$

$$= 4\sqrt{2}$$

Same answer

Rmk

To prove arc length is independent of parametrization
use change of variable for integration (Ex)
