\n- D. Getting to the Wave Equation
\n- (a) Wave Equation ? What have
$$
Equation
$$
 2 What does a have $Equation$ 2
\n- Take a familiar example : EM wave equation in vacuum
\n- $\nabla^2 \vec{E} = \frac{1}{C^2} \frac{\partial^2 \vec{E}}{\partial t^2}$ (same form for \vec{E}) $C = \frac{1}{\sqrt{\mu_0 \varepsilon_0}}$
\n- For a standard form\n $\vec{E} = \vec{E}_0 \quad \mathcal{C}^i \stackrel{(2\pi x - 2\pi ft)}{=} \vec{E}_0 \quad \mathcal{C}^i(kx - \omega t)$
\n- Substituting into wave equation gives the dispersion relation\n $k^2 = \frac{1}{C^2} \quad \text{or} \quad \omega = ck \quad \text{or} \quad f\lambda = C$
\n

+ In EM, the complex form is for convenience. We could use ~ cos (kx-cst).

\n- At
$$
t = 0
$$
, $\vec{E}(x, t_0) = \vec{E}_{g_1} e^{ik_1x} + \vec{E}_{g_2} e^{ik_2x}$ then $\vec{E}(x, t) = \vec{E}_{g_1} e^{ik_1x} e^{-i\omega t} + \vec{E}_{g_2} e^{ik_2x} e^{-i\omega t}$ (*)
\n- At $k = 0$, $\vec{E}(x, t) = \vec{E}_{g_1} e^{ik_1x} e^{-i\omega t}$ (*)
\n- At $k = 0$, $\vec{E}(x, t) = \vec{E}_{g_1} e^{ik_1x} + \vec{E}_{g_2} e^{ik_2x} e^{-i\omega t}$ (*)
\n- At $k = 0$, $\vec{E}(x, t) = \vec{E}_{g_1} e^{ik_1x} + \vec{E}_{g_2} e^{ik_2x} e^{-i\omega t}$
\n- At $k = 0$, $\vec{E}(x, t) = \vec{E}_{g_1} e^{ik_1x} + \vec{E}_{g_2} e^{ik_2x} e^{-i\omega t}$
\n- At $k = 0$, $\vec{E}(x, t) = \vec{E}_{g_1} e^{ik_1x} + \vec{E}_{g_2} e^{ik_2x} e^{-ik_2x}$
\n- At $k = 0$, $\vec{E}(x, t) = \vec{E}_{g_1} e^{ik_1x} + \vec{E}_{g_2} e^{ik_2x} e^{-ik_2x}$
\n- At $k = 0$, $\vec{E}(x, t) = \vec{E}_{g_1} e^{ik_1x} + \vec{E}_{g_2} e^{-ik_2x} e^{-ik_2x}$
\n- At $k = 0$, $\vec{E}(x, t) = \vec{E}_{g_1} e^{ik_1x} + \vec{E}_{g_2} e^{-ik_2x} e^{-i\omega t}$
\n- At $k = 0$, $\vec{E}(x, t$

(b) Quantum Particle (massive) de Broglie: $\lambda_{dB} = \frac{h}{b} = \frac{2\pi k}{b}$ · Particle with a definite $p \Rightarrow$ there is a (one value) definite λ · Free particle No force, constant potential energy over space $-\frac{\partial U}{\partial x} = F = 0$ "Take U = constant = 0 $E = \frac{1}{2}mv^2 = \frac{p^2}{2m}$ $\left|E=\frac{p^2}{2m}\right|$ plays the role of the dispersion relation

Recall: Using, photon properties,
$$
\vec{E} \sim \vec{E}_0 e^{i kx - i\omega t}
$$

\n $\sim \vec{E}_0 e^{i(\frac{px}{\hbar} - \frac{Et}{\hbar})}$
\n $\sim \vec{E}_0 e^{i(\frac{px}{\hbar} - \frac{Et}{\hbar})}$
\n ω have *from* $\Psi_{\text{c}}(x,t) \sim e^{i(2\pi x - \omega t)} \sim e^{i(\frac{px}{\hbar} - \frac{Et}{\hbar})}$
\n ω is *upaxi* defined by $\vec{E} = \frac{p^2}{2m}$
\n ω and \vec{E} and γ are related by $\vec{E} = \frac{p^2}{2m}$

The complex wavefunction for a free particle in QM is *a necessity* because a definite momentum implies $\Delta p=0$. The complex form gives $|\psi|^2$ = constant everywhere, thus corresponding to $\Delta x \rightarrow \infty$, as required. A sinusoidal wave will not work.

is a Wave Equation that would give the vight E-p relation?
