

# Basic Techniques: Recursion, Repeating, and Geometric Series

Yufei Tao

Department of Computer Science and Engineering  
Chinese University of Hong Kong

Today we will discuss three basic techniques of algorithm design:

- Recursion
- Repeating (till success)
- Geometric Series.

# Recursion

## Principle of recursion

When dealing with a subproblem (same problem but with a smaller input), consider it solved, and use the subproblem's output to continue the algorithm design.

## Tower of Hanoi

There are 3 rods A, B, and C.

On rod A,  $n$  disks of different sizes are stacked in such a way that no disk of a larger size is above a disk of a smaller size.

The other two rods are empty.

## Tower of Hanoi

**Permitted operation:** Move the top-most disk of a rod to another rod.

**Constraint:** No disk of a larger size can be above a disk of a smaller size.

**Goal:** Design an algorithm to move all the disks to rod B.

## Algorithm

Subproblem: Same problem but with  $n - 1$  disks.

Consider the subproblem solved (i.e., assume you already have an algorithm for it).

Now, solve the problem with  $n$  disks as follows:

## Analysis

Suppose that our algorithm performs  $f(n)$  operations to solve a problem of size  $n$ . Clearly,  $f(1) = 1$ . By recursion, we can write

$$f(n) = 1 + 2 \cdot f(n - 1)$$

Solving this recurrence gives  $f(n) = 2^n - 1$ .

Use recursion to “redesign” the following algorithms:

- Binary search
- Merge sort
- Quick sort.

Repeating till Success

**The  $k$ -Selection Problem:** You are given a set  $S$  of  $n$  integers in an array and an integer  $k \in [1, n]$ . Find the  $k$ -th smallest integer of  $S$ .

For example, suppose that  $S = (53, 92, 85, 23, 35, 12, 68, 74)$  and  $k = 3$ . You should output 35.

The **rank** of an integer  $v \in S$  is the number of elements in  $S$  smaller than or equal to  $v$ .

For example, suppose that  $S = (53, 92, 85, 23, 35, 12, 68, 74)$ . Then, the rank of 53 is 4, and that of 12 is 1.

**Easy:** The rank of  $v$  can be obtained in  $O(|S|)$  time.

Consider the following task:

**Task:** Assume  $n$  to be a multiple of 3. Obtain a subproblem of size at most  $2n/3$  with exactly the same result as the original problem.

Our goal is to produce a set  $S'$  and an integer  $k'$  such that

- $|S'| \leq 2n/3$
- $k' \in [1, |S'|]$
- The element with rank  $k'$  in  $S'$  is the element with rank  $k$  in  $S$ .

We will give an algorithm to accomplish the task in  $O(n)$  expected time.

Consider the following algorithm.

- 1 Take an element  $v \in S$  uniformly at random.
- 2 Divide  $S$  into  $S_1$  and  $S_2$  where
  - $S_1$  = the set of elements in  $S$  less than or equal to  $v$ ;
  - $S_2$  = the set of elements in  $S$  greater than  $v$ .
- 3 If  $|S_1| \leq k$ , then return  $S' = S_1$  and  $k' = k$ ;  
else return  $S' = S_2$  and  $k' = k - |S_1|$ .

The algorithm **succeeds** if  $|S'| \leq 2n/3$ , or **fails** otherwise.

Repeat the algorithm until it succeeds.

**Lemma:** The algorithm succeeds with probability at least  $1/3$ .

**Proof:** The algorithm always succeeds when the rank of  $v$  falls in  $[\frac{n}{3}, \frac{2}{3}n]$  (think: why?). This happens with a probability at least  $1/3$ , by the fact that  $v$  is taken from  $S$  uniformly at random.  $\square$

In general, if an algorithm succeeds with a probability **at least**  $c > 0$ , then the number of repeats needed for the algorithm to succeed for the first time is **at most**  $1/c$  in expectation.

We expect to repeat the algorithm at most 3 times before it succeeds. This implies that the expected running time is  $O(n)$  (think: why?).

## Geometric Series

A **geometric sequence** is an infinite sequence of the form

$$n, cn, c^2n, c^3n, \dots$$

where  $n$  is a positive number and  $c$  is a constant satisfying  $0 < c < 1$ .

It holds in general that

$$\sum_{i=0}^{\infty} c^i n = \frac{n}{1-c} = O(n).$$

The summation  $\sum_{i=0}^{\infty} c^i n$  is called a **geometric series**.

Geometric series are extremely important for algorithm design.

Consider again:

**The  $k$ -Selection Problem:** You are given a set  $S$  of  $n$  integers in an array and an integer  $k \in [1, n]$ . Find the  $k$ -th smallest integer of  $S$ .

## Algorithm

Using the repeating technique, now you should be able to convert the problem to a subproblem with size at most  $\lceil 2n/3 \rceil$  in  $O(n)$  expected time.

Now, apply the recursion technique. We have already obtained a (complete) algorithm solving the  $k$ -selection problem!

Think: How is this related to geometric series?

## Analysis

Let  $f(n)$  be the expected running time of our algorithm on an array of size  $n$ .

We know:

$$f(1) \leq O(1)$$

$$f(n) \leq O(n) + f(\lceil 2n/3 \rceil).$$

Solving the recurrence gives  $f(n) = O(n)$ .
