Basic Techniques: Recursion, Repeating, and Geometric Se

1/20

イロト イポト イラト イラト

Today we will discuss three basic techniques of algorithm design:

- Recursion
- Repeating (till success)
- Geometric Series.

2/20

イロト イポト イヨト イヨト

Recursion

Basic Techniques: Recursion, Repeating, and Geometric Se

Principle of recursion

When dealing with a subproblem (same problem but with a smaller input), consider it solved, and use the subproblem's output to continue the algorithm design.

Basic Techniques: Recursion, Repeating, and Geometric Se

4/20

< ロ > < 同 > < 回 > < 回 >

Tower of Hanoi

There are 3 rods A, B, and C.

On rod A, n disks of different sizes are stacked in such a way that no disk of a larger size is above a disk of a smaller size.

The other two rods are empty.

5/20

(4月) 4 ヨト 4 ヨト

Permitted operation: Move the top-most disk of a rod to another rod. **Constraint:** No disk of a larger size can be above a disk of a smaller size.

Goal: Design an algorithm to move all the disks to rod B.

Basic Techniques: Recursion, Repeating, and Geometric Se

6/20

イロト イポト イラト イラト

Subproblem: Same problem but with n-1 disks. Consider the subproblem solved (i.e., assume you already have an algorithm for it).

Now, solve the problem with n disks as follows:

Basic Techniques: Recursion, Repeating, and Geometric Se

7/20

Analysis

Suppose that our algorithm performs f(n) operations to solve a problem of size *n*. Clearly, f(1) = 1. By recursion, we can write

$$f(n) = 1+2 \cdot f(n-1)$$

Solving this recurrence gives $f(n) = 2^n - 1$.

Repeating till Success

Basic Techniques: Recursion, Repeating, and Geometric Se

The *k*-**Selection Problem:** You are given a set *S* of *n* integers in an array and an integer $k \in [1, n]$. Find the *k*-th smallest integer of *S*.

For example, suppose that S = (53, 92, 85, 23, 35, 12, 68, 74) and k = 3. You should output 35.

11/20

伺 ト イヨト イヨト

The **rank** of an integer $v \in S$ is the number of elements in S smaller than or equal to v.

For example, suppose that S = (53, 92, 85, 23, 35, 12, 68, 74). Then, the rank of 53 is 4, and that of 12 is 1.

Easy: The rank of v can be obtained in O(|S|) time.

12/20

・吊 ・ チョ ・ チョ・

Consider the following task:

Task: Assume *n* to be a multiple of 3. Obtain a subproblem of size at most 2n/3 with exactly the same result as the original problem.

Our goal is to produce a set S' and an integer k' such that

- |*S*′| ≤ 2*n*/3
- $k' \in [1, |S'|]$
- The element with rank k' in S' is the element with rank k in S.

We will give an algorithm to accomplish the task in O(n) expected time.

13/20

周 ト イ ヨ ト イ ヨ ト

Consider the following algorithm.

- **1** Take an element $v \in S$ uniformly at random.
- 2 Divide S into S_1 and S_2 where
 - S_1 = the set of elements in S less than or equal to v;
 - S_2 = the set of elements in S greater than v.
- If $|S_1| \ge k$, then return $S' = S_1$ and k' = k; else return $S' = S_2$ and $k' = k - |S_1|$.

The algorithm succeeds if $|S'| \le 2n/3$, or fails otherwise.

Repeat the algorithm until it succeeds.

э.

14/20

イロト 不得 とうほう イヨト

Lemma: The algorithm succeeds with probability at least 1/3.

Proof: The algorithm always succeeds when the rank of v falls in $\left[\frac{n}{3}, \frac{2}{3}n\right]$ (think: why?). This happens with a probability at least 1/3, by the fact that v is taken from S uniformly at random.

In general, if an algorithm succeeds with a probability at least c > 0, then the number of repeats needed for the algorithm to succeed for the first time is at most 1/c in expectation.

We expect to repeat the algorithm at most 3 times before it succeeds. This implies that the expected running time is O(n) (think: why?).

15/20

• □ • • □ • • □ •

Geometric Series

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ シタの

A geometric sequence is an infinite sequence of the form

$$n, cn, c^2n, c^3n, \ldots$$

where *n* is a positive number and *c* is a constant satisfying 0 < c < 1.

It holds in general that

$$\sum_{i=0}^{\infty} c^i n = \frac{n}{1-c} = O(n).$$

The summation $\sum_{i=0}^{\infty} c^{i} n$ is called a **geometric series**.

Geometric series are extremely important for algorithm design.

Basic Techniques: Recursion, Repeating, and Geometric Se

17/20

Consider again:

The *k*-**Selection Problem:** You are given a set *S* of *n* integers in an array and an integer $k \in [1, n]$. Find the k-th smallest integer of *S*.

< 日 > < 同 > < 三 > < 三 > .

18/20

Using the repeating technique, now you should be able to convert the problem to a subproblem with size at most $\lceil 2n/3 \rceil$ in O(n) expected time.

Now, apply the recursion technique. We have already obtained a (complete) algorithm solving the *k*-selection problem!

Think: How is this related to geometric series?

伺 ト イ ヨ ト イ ヨ ト

Let f(n) be the expected running time of our algorithm on an array of size n.

We know:

$$\begin{array}{rcl} f(1) & \leq & O(1) \\ f(n) & \leq & O(n) + f(\lceil 2n/3 \rceil). \end{array}$$

Solving the recurrence gives f(n) = O(n).

Basic Techniques: Recursion, Repeating, and Geometric Se
