(日)

Strongly Connected Component

Let G = (V, E) be a directed simple graph.

A strongly connected component (SCC) of G is a subset S of V s.t.

- for any two vertices $u, v \in S$, G has a path from u to v and a path from v to u;
- *S* is maximal in the sense that we cannot put any more vertex into *S* without breaking the above property.

2/18

イロト イポト イラト イラト

- $\{a, b, c\}$ is an SCC.
- $\{a, b, c, d\}$ is not an SCC.
- $\{d, e, f, k, l\}$ is not an SCC (because we can still add vertex g).
- $\{e, d, f, k, l, g\}$ is an SCC.

3/18

Lemma 1: Suppose that S_1 and S_2 are both SCCs of G. Then, $S_1 \cap S_2 = \emptyset$.

The proof is easy and left to you.

Given a directed graph G = (V, E), the goal of the **strongly connected components problem** is to divide V into disjoint subsets, each being an SCC.

Finding Strongly Connected Components

5/18

Step 1: Run DFS on *G*, and list the vertices by the order they turn black (i.e., popped from the stack).

If vertex $u \in V$ is the *i*-th turning black, we label u with i.

Finding Strongly Connected Components

6/18

・ロト ・同ト ・ヨト ・ヨト

Start DFS from *i* and re-start from *j*.

The following is a possible turn-black order: h, b, c, a, l, k, f, e, d, g, i, j.

• Note: the order is not unique.

```
The label of c is 3.
The label of g is 10.
The label of i is 11.
The label of j is 12.
```

7/18

Algorithm

Step 2: Obtain the reverse graph *G*^{rev} by reversing the directions of all the edges in G.

B b **Finding Strongly Connected Components** 8/18

Yufei Tao

Algorithm

Step 3: Perform DFS on *G*^{rev} subject to the following rules:

- Rule 1: Start at the vertex with the largest label.
- **Rule 2:** When a restart is needed, do so from the white vertex with the largest label.

Output the set of vertices in each DFS-tree as an SCC.

9/18

Example

Vertices in ascending order of label: h, b, c, a, l, k, f, e, d, g, i, j. Reverse graph G^{rev} :

Start DFS from j, which finishes immediately and discovers only j.

• First SCC: $\{j\}$

Restart from i, which finishes after discovering i and h

a

• Second SCC: {*i*, *h*}

Restart from g, which finishes after discovering g, e, d, f, l, and k

• Third SCC: {*g*, *e*, *d*, *f*, *l*, *k*}

Restart from a, which finishes after discovering a, b, and c.

• Fourth SCC: {*a*, *b*, *c*}

10/18

- 4 周 ト 4 ヨ ト 4 ヨ ト

Theorem: Our SCC algorithm finishes in O(|V| + |E|) time.

The proof is left as a regular exercise.

Next, we will prove that the algorithm correctly returns all the SCCs.

Finding Strongly Connected Components

11/18

(日本)

Suppose that the input graph G has SCCs $S_1, S_2, ..., S_t$ for some $t \ge 1$.

The **SCC graph** *G*^{scc} is defined as follows:

- Each vertex in G^{scc} is a distinct SCC in G.
- For every two distinct vertices (a.k.a. SCCs) S_i and S_j (1 ≤ i, j ≤ t), G^{scc} has an edge from S_i to S_j if some vertex of S_i has an edge in G to a vertex of S_j.

For each SCC S_i ($i \in [1, t]$), define

$$label(S_i) = \max_{v \in S_i} label of v$$

14/18

・ 同 ト ・ ヨ ト ・ ヨ ト

Lemma 2: If SCC S_i (for some $i \in [1, t]$) has an edge to SCC S_j (for some $j \in [1, t]$) in G^{scc} , then $label(S_i) > label(S_j)$.

Proof: Let *u* be the first vertex in $S_i \cup S_j$ that turns gray in DFS (i.e., *u* is the first vertex in $S_i \cup S_j$ discovered by DFS).

- If $u \in S_i$, u has a white path to every vertex in $S_i \cup S_j$. By the white path theorem, u turns black after all the vertices in S_j and is the last vertex in S_i turning black. This implies $label(S_i) > label(S_j)$.
- If u ∈ S_j, u has a white path to every vertex in S_j but no white path to any vertex in S_i. By the white path theorem, u turns black after all the vertices in S_j and before every vertex in S_i. This again implies label(S_i) > label(S_j).

15/18

Henceforth, we arrange $S_1, S_2, ..., S_t$ such that

 $label(S_1) > label(S_2) > ... > label(S_t).$

Corollary 3: Fix any $i \in [1, t]$. Consider any vertex $u \in S_i$. In G^{rev} (i.e., the reverse graph), if (v, u) is an incoming edge of u and yet $v \notin S_i$, then v belongs to some S_i with j > i.

Proof: As (v, u) is in G^{rev} , G has an edge from u to v. Hence, S_i has an edge to S_i in G^{scc} .

By Lemma 2, $label(S_i) > label(S_j)$, which means j > i.

<日、</p>

Correctness

Lemma 4: Consider the DFS on G^{rev} (in Step 3 of our algorithm). For each $i \in [1, t]$, S_i is exactly the set of vertices in the *i*-th DFS-tree produced.

Proof: We will prove the claim by induction on *i*.

Consider i = 1. Let u be the vertex in S_1 having the largest label; u is the root of the first DFS-tree. Consider the beginning moment of the first DFS on G^{rev} .

- As S_1 is an SCC, u has a white path to every other vertex in S_1 .
- By Corollary 3, u has no white path to any vertex outside S_1 .

By the white path theorem, all and only the vertices in S_1 are descendants of u in the first DFS tree. The claim thus holds for i = 1.

17/18

(4月) (3日) (3日)

Correctness

Proof (cont.): Assuming that the claim holds for i = k - 1 (where $k \ge 2$), next we prove its correctness for i = k. Let u be the vertex in S_k having the largest label; u is the root of the k-th DFS-tree. Consider the beginning moment of the k-th DFS on G^{rev} .

- All the vertices in $S_1, S_2, ..., S_{k-1}$ are black.
- As S_k is an SCC, u has a white path to every other vertex in S_k .
- By Corollary 3, u has no white path to any vertex in $S_{k+1}, S_{k+2}, ..., S_t$.

By the white path theorem, all and only the vertices in S_k are descendants of u in the k-th DFS tree. The claim thus holds for i = k.
