Case (b) $L = \pm\infty$. (of Thm 6.3.5)

subcase $L = +\infty$

$$\lim_{x \to a+} \frac{f'(x)}{g'(x)} = +\infty \quad \text{implies that}$$

$$\forall M > 1, \ \exists \delta > 0 \ \text{s.t.} \ \frac{f'(u)}{g'(u)} > M$$

and hence
$$\frac{f(\beta) - f(\alpha)}{g(\beta) - g(\alpha)} > M, \quad \forall\, a < \alpha < \beta < a + \delta$$

As in case (a), $\lim_{x \to a+} g(x) = +\infty$ implies

$\exists\, c \ \& \ c_1 \in (a, a+\delta)$ such that

$$\begin{cases} \bullet \ a < c_1 < c < a + \delta \\ \bullet \ g(\alpha) > 0, \ \forall \alpha \in (a, c] \\ \bullet \ 0 < \dfrac{g(c)}{g(\alpha)} < \dfrac{1}{2}, \ \forall \alpha \in (a, c_1) \\ \bullet \ 0 \le \dfrac{|f(c)|}{g(\alpha)} < \dfrac{1}{2}, \ \forall \alpha \in (a, c_1) \end{cases}$$

Letting $\beta = c$, we have

$$\frac{f(c) - f(\alpha)}{g(c) - g(\alpha)} > M, \quad \forall \alpha \in (a, c)$$

(both terms < 0)

And hence for $\alpha \in (a, c_1)$

$\left(1 - \frac{g(c)}{g(\alpha)} > \frac{1}{2}\right)$

$$\frac{f(\alpha) - f(c)}{g(\alpha)} > M\left(1 - \frac{g(c)}{g(\alpha)}\right) > \frac{1}{2} M, \quad \forall \alpha \in (a, c_1)$$

$$\Rightarrow \quad \frac{f(\alpha)}{g(\alpha)} > \frac{1}{2}M + \frac{f(c)}{g(\alpha)} > \frac{1}{2}M - \frac{1}{2}$$

$$= \frac{1}{2}(M-1), \qquad \forall \alpha \in (a, c_1)$$

Since $M>1$ is arbitrary, this shows that

$$\lim_{x \to a^+} \frac{f(x)}{g(x)} = +\infty.$$

Subcase of "$L=-\infty$" is similar. ※

<u>eg 6.3.6</u>

(a) $\lim_{x\to\infty} \frac{\ln x}{x}$

- $f(x) = \ln x$ has derivative $f'(x) = \frac{1}{x}$ on $(0,\infty)$
- $g(x) = x$ has derivative $g'(x) = 1 \neq 0$ on $(0,\infty)$
- $\lim_{x\to\infty} g(x) = +\infty$
- $\lim_{x\to\infty} \frac{f'(x)}{g'(x)} = \lim_{x\to\infty} \frac{1/x}{1} = 0$

$\therefore$ L'Hospital Rule II $\Rightarrow \lim_{x\to\infty} \frac{\ln x}{x} = 0$.

(usually, one simply write $\lim_{x\to\infty} \frac{\ln x}{x} = \lim_{x\to\infty} \frac{\frac{1}{x}}{1} = 0$)

(b) $\lim_{x\to\infty} e^{-x}x^2 = \lim_{x\to\infty} \frac{x^2}{e^x}$

- $(x^2)' = 2x$, $\forall x$
- $(e^x)' = e^x \neq 0$, $\forall x$
- $e^x \to +\infty$ as $x \to +\infty$

But $\lim_{x\to\infty} \frac{2x}{e^x}$ still indeterminate.

So we need to start with $\lim_{x\to\infty} \frac{2x}{e^x}$ first:

- $(2x)' = 2$, $\forall x$
- $(e^x)' = e^x \neq 0$, $\forall x$
- $e^x \to +\infty$ as $x \to +\infty$
- $\lim_{x\to\infty} \frac{2}{e^x} = 0$ (exists)

$\therefore$ L'Hospital Rule $\Rightarrow$ $\lim_{x\to\infty} \frac{2x}{e^x} = 0$ (exists)

And applying L'Hospital Rule again, $\lim_{x\to\infty} \frac{x^2}{e^x} = 0$.

(We usually just write

$$\lim_{x\to\infty} e^{-x}x^2 = \lim_{x\to\infty} \frac{x^2}{e^x} = \lim_{x\to\infty} \frac{2x}{e^x} = \lim_{x\to\infty} \frac{2}{e^x} = 0.\ )$$

(c) $\displaystyle \lim_{x\to 0^+} \frac{\ln \sin x}{\ln x} = \lim_{x\to 0^+} \frac{(\ln \sin x)'}{(\ln x)'}$

$$= \lim_{x\to 0^+} \frac{\frac{\cos x}{\sin x}}{\frac{1}{x}} = \lim_{x\to 0^+} \cos x \cdot \frac{x}{\sin x}$$

$$= 1 \qquad \left(\text{as } \lim_{x\to 0^+} \frac{x}{\sin x} = 1 = \lim_{x\to 0^+} \cos x \right)$$

(d) It is easy to see $\displaystyle \lim_{x\to\infty} \frac{x-\sin x}{x+\sin x} = \lim_{x\to\infty} \frac{1-\frac{\sin x}{x}}{1+\frac{\sin x}{x}} = 1.$

However, $\displaystyle \lim_{x\to\infty} \frac{(x-\sin x)'}{(x+\sin x)'} = \lim_{x\to\infty} \frac{1-\cos x}{1+\cos x}$ doesn't exist.

$\therefore$ The condition " $\displaystyle \lim_{x\to a^+} \frac{f'(x)}{g'(x)}$ exists" is <u>necessary</u>

for L'Hospital Rule.

<u>Further examples</u> (other indeterminate forms)

<u>eg 6.3.7</u>

(a) ($\infty - \infty$ form)

$$\lim_{x\to 0^+} \left(\frac{1}{x} - \frac{1}{\sin x} \right) \qquad \left(x \in (0, \tfrac{\pi}{2}) \right)$$

$$= \lim_{x\to 0^+} \frac{\sin x - x}{x \sin x} \qquad \left(\text{transform to } \tfrac{0}{0} \text{ form} \right)$$

$$= \lim_{x\to 0+} \frac{\cos x - 1}{\sin x + x\cos x}$$ (L'Hospital) (still $\frac{0}{0}$ form)

$$= \lim_{x\to 0+} \frac{-\sin x}{2\cos x - x\sin x}$$ (L'Hosptial)

$$= 0$$ (limit exists, calculation justified)

(b) ($0\cdot(-\infty)$ form)

$$\lim_{x\to 0+} x\ln x$$ ($x\in(0,\infty)$)

$$= \lim_{x\to 0+} \frac{\ln x}{1/x}$$ (transforms to $\frac{-\infty}{\infty}$ form)

$$= \lim_{x\to 0+} \frac{\frac{1}{x}}{-\frac{1}{x^2}}$$ (L'Hospital)

$$= \lim_{x\to 0+}(-x) = 0$$ (limit exists, calculation justified)

(c) (0^0 form)

$$\lim_{x\to 0+} x^x$$

$$= \lim_{x\to 0+} e^{x\ln x}$$

$$= e^{\lim_{x\to 0+} x\ln x}$$ (transforms to $0\cdot(-\infty)$ form which can be calculated using L'Hospital as in (b))

$$= e^0 = 1$$

(d) (1^∞ form)

$$\lim_{x\to\infty}\left(1+\frac{1}{x}\right)^x \qquad x\in(1,\infty)$$

$$=\lim_{x\to\infty} e^{x\ln(1+\frac{1}{x})}$$

Transforms to the calculation of

$$\lim_{x\to\infty} x\ln\left(1+\frac{1}{x}\right) \qquad (\infty\cdot 0 \text{ form})$$

$$=\lim_{x\to\infty}\frac{\ln\left(1+\frac{1}{x}\right)}{\frac{1}{x}} \qquad \left(\text{transform to } \tfrac{0}{0} \text{ form}\right)$$

$$=\lim_{x\to\infty}\frac{\left(\frac{1}{1+\frac{1}{x}}\right)\cdot\left(-\frac{1}{x^2}\right)}{\left(-\frac{1}{x^2}\right)} \qquad (\text{L'Hospital})$$

$$=\lim_{x\to\infty}\frac{1}{1+\frac{1}{x}}=1 \qquad (\text{limit exists, calculation justified})$$

And hence $\lim_{x\to\infty}\left(1+\frac{1}{x}\right)^x = e^{\lim_{x\to\infty} x\ln(1+\frac{1}{x})} = e$

(e) (∞^0 form)

$$\lim_{x\to 0+}\left(1+\frac{1}{x}\right)^x \qquad (x\in(0,\infty)) \qquad (\text{limit of the other end})$$

$$= e^{\lim_{x\to 0+} x\ln(1+\frac{1}{x})} \qquad (\text{transform to } 0\cdot\infty \text{ form})$$

$$= e^{\lim_{x\to 0+}\frac{1}{1+\frac{1}{x}}} \qquad (\text{L'Hospital as before})$$

$$= e^0 = 1. \qquad (\text{limit exists, calculation justified})$$
