- 1. Show that the uniform limit of
  a sequence of continuous functions
  is continuous, and hence that if  $m(E) < +\infty$ and  $f: E \to |R|$  to measurable then,  $\forall \eta > 0$ ,  $\exists$  closed set  $F \subseteq E$  with  $m(E \setminus F) < \eta$ such that  $f|_F: F \to |R|$  to continuous.
- 2. Let  $F = \bigcup_{n=1}^{\infty} F_n$ , disjoint closed sets  $F_i$ ,..., $F_n$ . Let  $f: F \to IR$  he such that  $f/F_n$  is Cto,  $Y_n$ . Show that f is Cto.
- 3. Let  $Fn \subseteq (n, n+1)$  be closed  $(R \mid Fn \circ p)$   $\forall n \in \mathbb{N}$ , and let  $F = \bigcup_{n \in \mathbb{N}} Fn$ . 8 how that  $f : F \rightarrow \mathbb{R}$  is continuous if each  $f|_{Fn}$  is cts. (Can the condition  $Fn \subseteq (n, n+1)$  be weakened to  $Fn \subseteq \mathbb{R}$ ?)

4. Let  $G = \widetilde{\bigcup}_{n=1} I_n$ , comfable disjoint open intern In, and let F: RIG. Let X<Y<Z with X, Z ∈ F and y ∈ In = (an, bn). Show hat an EF, bn EF, X San, and by SJ 5. Let G, In, F he as in Q4, and let f: IR-IR be such har  $J|_F$  and  $f|_{\overline{I}_n}$ . be continuous, Yn & M (In denotes the closure of In). Inproce further That the graph of  $f|_{\widehat{T}}$  is a line-segment. Show that f is continuous ( by symmetry, held only 8how that I is right-containing at each  $\chi_0 \in \mathbb{R}$ :  $\lim_{\chi \to \chi_0 + \chi} f(\chi) = f(\chi), i.e. \forall \xi \neq 0$ ]  $\begin{cases} 50 \text{ min } \chi \to \chi_0 + \chi_0 \\ |f(\chi) - f(\chi)| < \xi \quad \forall \chi \in \chi_0, \chi_0 + \delta \end{cases}$ This is evident if 20EG (SOF NEW SIX 20 (In). We may here assume that x0 EF, and have are three cases
