What do you think about using robots in education? Let's see what other people think.

What is a robot ?

Robots are electronic machines that look like humans. They can do different things to help humans at work.

Will robots replace teachers in the near future ?

Will robots replace teachers in the near future? I think they will. Technology improves very fast. In recent years, governments around the world have strongly promoted technology. Electronic devices have become an integral part of education, and robots are no exceptions.

My robot, Viona

Robots in the future will be diversified. My robot, Viona, is an example.

What key features does Viona have ?

She has lots of functions to help teachers and students, such as a marking homework system, a scanning and recording system, and an emotion-sensing system, etc. Let me tell you more about the functions of my robot.

1. Marking homework system:

This is a system that helps a teacher to mark homework. Viona uses her camera to look at the homework and the system will automatically check it. Then, her hands will mark the homework just like a human. This system shortens the time needed to mark homework.

2. Scanning and recording system:

This system records student's learning results and their performance in class. It will help schools to schedule a better course for students.

3. Emotion sensing system:

Many people are worried about robots not being able to understand human feelings. This system will change their mind. This system will sense people's feelings by looking at human's facial expressions and listening to the human's voices. Therefore, Viona can console students when they are unhappy.

4. Solar energy absorbing system:

In these years, many people pay attention to being environmentally friendly and lots of people think that robots are wasting power. However, this system uses solar energy to replace electricity. Therefore, it doesn't waste electricity.

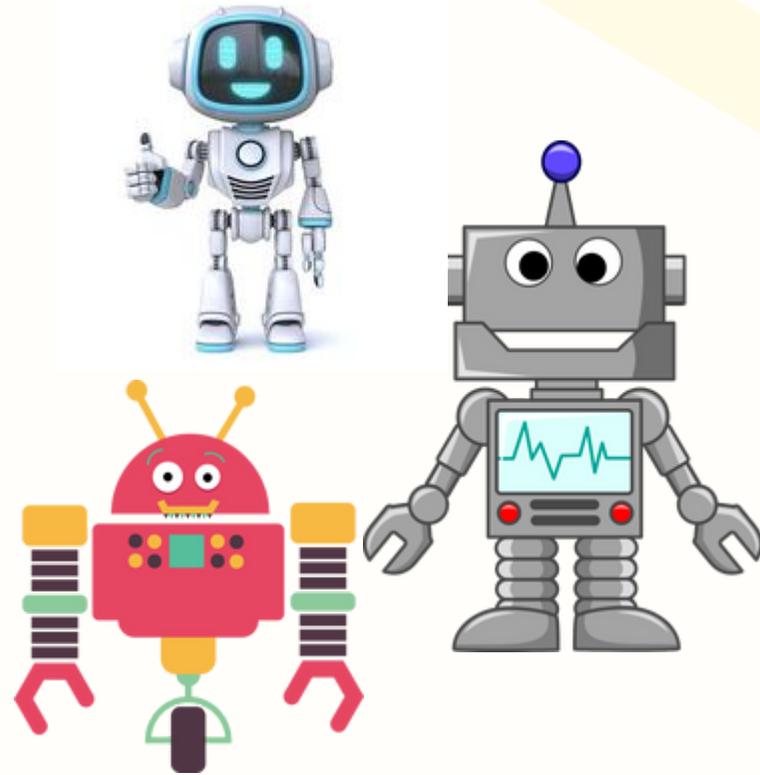

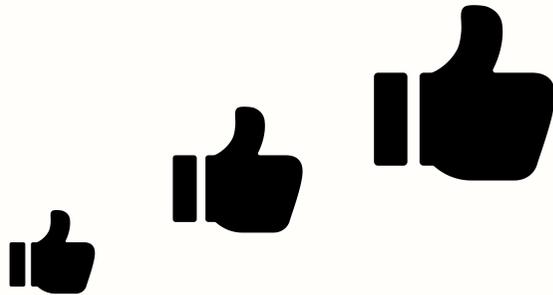

5. Problem solving system:

Some people think that robots do not shout at students and it makes students too nonchalant about schooling. This system will solve this problem. When the students do not behave well in class, Viona can appropriately give a lesson to the students.

# *Robots will replace teachers in the near future.*

My robot, Viona, is a good example of robots in the near future. Humans cannot constrain the development of technology in the future, so robots in the future can be unlimited.

Since governments around the world have strongly promoted robots, why don't we let robots replace teachers in the new future and make a better world?

Will robots replace teachers in the near future ?

In these years, technology has improved a lot. Technology has become a trend and governments around the world have strongly promoted robots in different parts. Do you want to know more about robots in the future ? I will tell you and share about my robot, Viona, with you.
