LC-3b Simulator

LC-3b Basis

LC-3b Assembly Examples

LC-3b Simulator

Assembler & Simulator

- Assembly language symbolic (MIPS, LC-3b, ...)
- Machine language binary
- Assembler is a program that
 - turns symbols into machine instructions.
 - ► EX: lc3b_asm, SPIM, ...
- Simulator is a program that
 - mimics the behavior of a processor
 - usually in high-level language
 - EX: lc3b_sim, SPIM, ...

LC-3b

- ► LC-3b: **Little Computer 3, b** version.
- Relatively simple instruction set
- Most used in teaching for CS & CE
- Developed by Yale Patt@UT & Sanjay J. Patel@UIUC

LC-3b Instructions

- 16 bit instruction
- ▶ Memory address space is 16 bits → 2¹⁶ locations
- Each memory address containing one byte (eight bits).
- One instruction or declaration per line

LC-3b Basis

LC-3b Assembly Examples

LC-3b Simulator

LC-3b Example 1: Do nothing

"./lc3b_asm nop.asm nop.cod"

nop.asm: nop.cod:

.ORIG x3000
NOP
NOP
.END

▶ NOP instruction translates into machine code 0x0000.

Assembler Directives

- Directives give information to the assembler
- Not executed by the program
- All directives start with a period "."

.ORIG	Where to start in placing things in memory
.FILL	Declare a memory location (variable)
.END	Tells assembly where your program source ends

Assembler Directives: .ORIG

- Tells where to put code in memory (starting location)
- Only one .ORIG allowed per program module
- PC is set to this address at start up
- Similar to the main() function in C
- Example:

```
.ORIG x3000
```

Assembler Directives: .FILL

- Declaration and initialization of variables
- Always declaring words
- Examples:

```
flag .FILL x0001
counter .FILL x0002
letter .FILL x0041
letters .FILL x4241
```

Assembler Directives: .END

- Tells the assembler where your program ends
- Only one .END allowed in your program module
- NOT where the execution stops!

LC-3b Example 2: Count from 10 to 1

count10.asm: count10.cod:

.ORIG x3000 LEA RO, TEN LDW R1, R0, #0 START ADD R1, R1, #-1BRZ DONE BR START DONE TRAP ×25 TEN .FILL x000A .END

0x3000 0xE005 0x6200 0x127F 0x0401 0x0FFD 0xF025 0x000A

More explanations will be in Lab2-2.

LC-3b Basis

LC-3b Assembly Examples

LC-3b Simulator

LC-3b Simulator: lc3b_sim

- Download from course website (lab2_assignment.tar.gz)
- The simulator will
 - Execute the input LC-3b program
 - one instruction at a time
 - Modify the architectural state of the LC-3b
- Two main sections: the shell and the simulation routines
- Only need to work on simulation routine part.

LC-3b Shell

./lc3b_sim [cod file]

```
LC-3b-SIM> ?

-------LC-3b ISIM Help-------
go - run program to completion
run n - execute program for n instructions
mdump low high - dump memory from low to high
rdump - dump the register & bus values
? - display this help menu
quit - exit the program

LC-3b-SIM>
```

LC-3b Architecture State

- Please refer to LC-3b_ISA for more details
- PC
- General purpose registers (REGS): 8 registers
- Condition codes: N (negative); Z (zero); P (positive).

```
65 #define LC 3b REGS 8
66
67 /* Data Structure for Latch */
68 typedef struct System_Latches_Struct{
      int PC, /* program counter */
69
                          /* n condition bit */
70
          Ν,
71
          Ζ,
                        /* z condition bit */
72
                          /* p condition bit */
      int REGS[LC_3b_REGS]; /* register file. */
74 } System_Latches;
75
76 System_Latches CURRENT_LATCHES, NEXT_LATCHES;
```

LC-3b Memory Structure

Two word-aligned locations are to store one 16-bit word.

- addresses differ only in bit 0
- Locations x0006 and x0007 are word-aligned

```
276 void init_memory() {
277    int i;
278
279    for (i=0; i < WORDS_IN_MEM; i++) {
280         MEMORY[i][0] = 0;
281         MEMORY[i][1] = 0;
282    }
283 }</pre>
```

How to use LC-3b Simulator?

- 1. Compile your C codes through make command.
- 2. Run the compiled LC-3b simulator through ./1c3b_sim2 bench/xxx.cod. Here the parameter is a machine code file.
- 3. In the simulator, run "n" instructions. When n = 3, run 3
- 4. In the simulator, print out register information: rdump

LC-3b Basis

LC-3b Assembly Examples

LC-3b Simulator

Lab2 Task 1

architectural state:

- ▶ In process_instruction(), update NEXT_LATCHES
- At this moment, only update (increase PC value)

memory:

- ► Given CURRENT_LATCHES.PC, read related word in memory
- ▶ Implement function int memWord (int startAddr)

Task 1 Golden Results: nop.cod

Output after run 2

```
process_instruction() | curInstr = 0x0000
process_instruction() | curInstr = 0x0000
```

Output after rdump:

```
Instruction Count : 2
PC : 0x3004
CCs: N = 0 Z = 1 P = 0
Registers:
0: 0x0000
1: 0x0000
2: 0x0000
3: 0x0000
4: 0x0000
5: 0x0000
6: 0x0000
7: 0x0000
```

Task 1 Golden Results: count10.cod

Output after run 7:

```
process_instruction() | curInstr = 0xe005
process_instruction() | curInstr = 0x6200
process_instruction() | curInstr = 0x127f
process_instruction() | curInstr = 0x0401
process_instruction() | curInstr = 0x0ffd
process_instruction() | curInstr = 0xf025
Simulator halted
```

Output after rdump:

```
Instruction Count : 6
PC : 0x0000
CCs: N = 0 Z = 1 P = 0
Registers:
0: 0x0000
1: 0x0000
2: 0x0000
3: 0x0000
4: 0x0000
5: 0x0000
6: 0x0000
7: 0x300c
```

Task 1 Golden Results: toupper.cod

Output after run 18:

```
process_instruction() | curInstr = 0xe00f
process instruction() | curInstr = 0x6000
process instruction() | curInstr = 0x6000
process instruction() | curInstr = 0xe20d
process instruction() | curInstr = 0x6240
process instruction() | curInstr = 0x6240
process_instruction() | curInstr = 0x2400
process_instruction() | curInstr = 0x0406
process_instruction() | curInstr = 0x14b0
process instruction() | curInstr = 0x14b0
process instruction() | curInstr = 0x3440
process_instruction() | curInstr = 0x1021
process_instruction() | curInstr = 0x1261
process instruction() | curInstr = 0x0ff8
process_instruction() | curInstr = 0x3440
process instruction() | curInstr = 0xf025
Simulator halted
```

Task 1 Golden Results: toupper.cod (cont.)

Output after rdump:

```
Instruction Count : 16
PC : 0x0000
CCs: N = 0 Z = 1 P = 0
Registers:
0: 0x0000
1: 0x0000
2: 0x0000
3: 0x0000
4: 0x0000
5: 0x0000
6: 0x0000
7: 0x3020
```
