

MATH 2050C Lecture 25 (Apr 20)

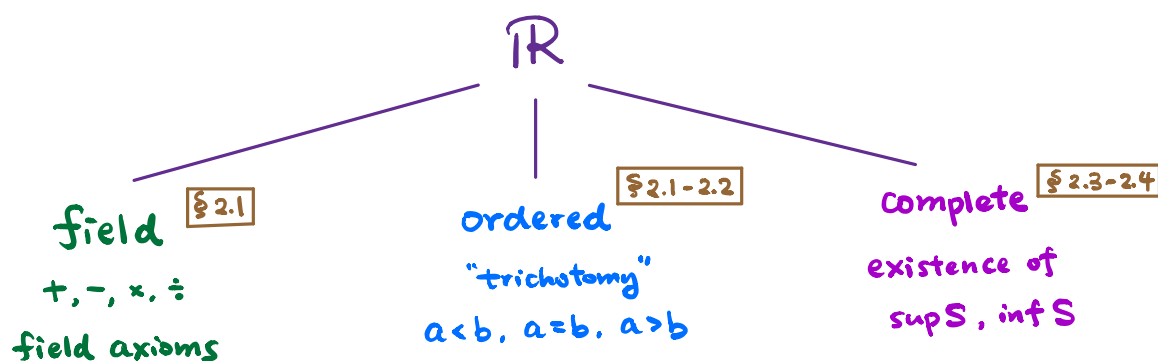

Final: May 11 (Thurs) 9:30 am - 11:30 am

Topics to be covered: (refer to Bartle (4th Ed.))

- § 2.1 - 2.5 (except binary/decimal representations)
- § 3.1 - 3.5
- § 4.1 - 4.2
- § 5.1 - 5.4 (except approximation by step functions/polynomials)

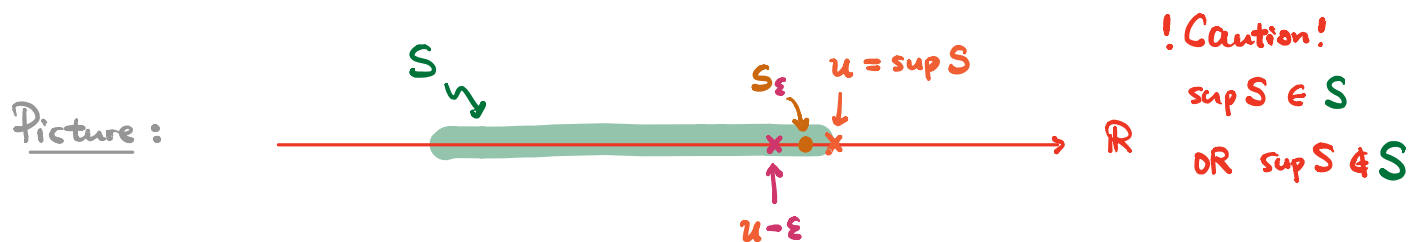

REVIEW SESSION

Chapter 2 The Real Numbers

Completeness Property: Every $\emptyset \neq S \subseteq \mathbb{R}$ that is **bounded above** has a supremum in $\mathbb{R}$.
§2.3

Defⁿ:
§2.3 $u = \sup S \iff \begin{cases} u \geq s \quad \forall s \in S \\ \forall \varepsilon > 0, \exists s_\varepsilon \in S \text{ st. } u - \varepsilon < s_\varepsilon \end{cases}$

Useful Inequalities: §2.2 AM-GM ineq., (reversed) triangle ineq., Bernoulli's ineq.

Useful Facts: §2.4

- $\mathbb{N}$ is NOT bounded above (Archimedean Property)
- (from completeness).
- Density of $\mathbb{Q}$ and $\mathbb{R} \setminus \mathbb{Q}$ in $\mathbb{R}$
- Existence of $\sqrt{2}$

Intervals: • characterization of intervals ("Connectedness")

§2.5

• Nested Interval Property: ("compactness")

$$I_1 \supseteq I_2 \supseteq I_3 \supseteq \dots$$

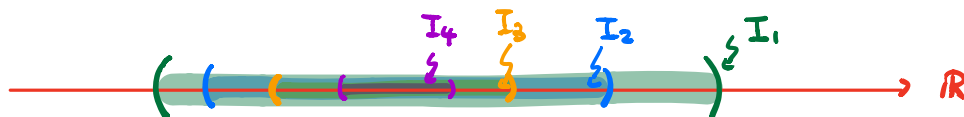

closed and bounded intervals

$$\Rightarrow \bigcap_{n=1}^{\infty} I_n \neq \emptyset$$

$$\bigcap_{n=1}^{\infty} (0, \frac{1}{n}) = \emptyset$$

$$\bigcap_{n=1}^{\infty} [n, \infty) = \emptyset$$

Picture:

Chapter 3 Sequences (and Series)

Set

$\{x_n: n \in \mathbb{N}\} \neq$ seq. $(x_n) = (x_1, x_2, x_3, x_4, \dots) : \mathbb{N} \rightarrow \mathbb{R}$

Defⁿ:

§3.1 $\lim (x_n) = L \iff \forall \varepsilon > 0, \exists K \in \mathbb{N} \text{ s.t. } |x_n - L| < \varepsilon \quad \forall n \geq K$

← depends on ε

§3.2

Limit Thm A: If $\lim (x_n)$ and $\lim (y_n)$ exist, then

• $\lim (x_n \pm y_n) = \lim (x_n) \pm \lim (y_n)$

• $\lim (x_n y_n) = \lim (x_n) \lim (y_n)$ $(\frac{1}{n}) \rightarrow 0$

• $\lim \left(\frac{x_n}{y_n} \right) = \frac{\lim (x_n)}{\lim (y_n)}$ ← Provided: $y_n \neq 0$, $\lim (y_n) \neq 0$ ✱

§3.2

Limit Thm B: If $\lim (x_n)$ and $\lim (y_n)$ exist, then

" $x_n \leq y_n \quad \forall n \in \mathbb{N} \implies \lim (x_n) \leq \lim (y_n)$ "

[! Caution! Only get " $\leq$ " even if $x_n < y_n \quad \forall n \in \mathbb{N}$. E.g. $0 < \frac{1}{n}$]

§3.2

FACT: (x_n) convergent $\implies (x_n)$ bounded

← + monotone
Monotone Convergence
Thm §3.3

$$(x_n) = ((-1)^n)$$

$$(x_n) = \left(\frac{1}{n} \right)$$

$$(x_n) = \left(\frac{(-1)^n}{n} \right)$$

To show (x_n) divergent

(I) (x_n) unbounded §3.2

(II) $\exists$ two subseq of (x_n)

$$(x_{n_k}) \rightarrow L$$

$$(x_{m_k}) \rightarrow L' \quad \#$$

§3.4

do NOT need to know the limit

To show (x_n) convergent

(I) ϵ - N definition §3.1

(II) Limit thms §3.2

(III) Squeeze thm §3.2

(IV) Monotone Convergence Thm §3.3

(V) Cauchy criteria §3.5

Defⁿ: §3.5

(x_n) is Cauchy $\Leftrightarrow$

$\forall \epsilon > 0, \exists H \in \mathbb{N}$ s.t.

depends on ϵ

$$|x_n - x_m| < \epsilon \quad \forall n, m \geq H$$

§3.5

Cauchy Criteria: (x_n) convergent $\Leftrightarrow$ (x_n) Cauchy

no relation between them

"iff"

§3.4

Bolzano-Weierstrass Thm: Any bounded seq has a convergent subseq.

[! Caution! May have different subseq's converging to different limits.]
E.g. $((-1)^n) \rightsquigarrow \limsup$ & $\liminf$

Chapter 4 Limits (of functions)

Setup: $f: A \rightarrow \mathbb{R}$, $c \in \mathbb{R}$ is a cluster pt of A

[! Caution! Either $c \in A$ or $c \notin A$ is possible E.g.) $A = [0, 1)$]

Defⁿ:

$$\lim_{x \rightarrow c} f(x) = L \Leftrightarrow$$

$\forall \epsilon > 0, \exists \delta > 0$ s.t.

depends on ϵ

$$|f(x) - L| < \epsilon \quad \forall x \in A, \quad 0 < |x - c| < \delta$$

$x \neq c$

Sequential Criteria: §4.1

limit of seq.

$$\lim (f(x_n)) = L$$

$$\lim_{x \rightarrow c} f(x) = L \Leftrightarrow$$

limit of function

$\forall$ seq. (x_n) in $A \setminus \{c\}$ s.t. $\lim(x_n) = c$

$x_n \neq c$

[FACT: Useful to show $\lim_{x \rightarrow c} f(x)$ does NOT exist. E.g.) $f(x) = \sin \frac{1}{x}$]

- Limit Thm A and B carries over from seq. to functions

§4.2

Chapter 5 Continuous Functions

§5.1

Defⁿ: $f: A \rightarrow \mathbb{R}$

is continuous at $c \in A$

$$\Leftrightarrow \forall \varepsilon > 0, \exists \delta > 0 \text{ st. } |f(x) - f(c)| < \varepsilon \quad \forall x \in A, |x - c| < \delta$$

← depends on ε (and c)
no $0 <$

[! Caution! Unlike $\lim_{x \rightarrow c} f(x)$, we NEED $c \in A$ here.]

Sequential Criteria: §5.1

$f: A \rightarrow \mathbb{R}$
is cts at a
cluster pt. $c \in A$

$$\Leftrightarrow \lim (f(x_n)) = f(c) \quad \forall \text{ seq. } (x_n) \text{ in } A \text{ st. } \lim(x_n) = c$$

[FACT: Useful to show Discontinuity at c . E.g.) $f(x) = \begin{cases} 1 & x \in \mathbb{Q} \\ 0 & x \notin \mathbb{Q} \end{cases}$]

§5.2

Facts: f, g cts $\Rightarrow f \pm g, fg, f/g, f \circ g$ new! composition

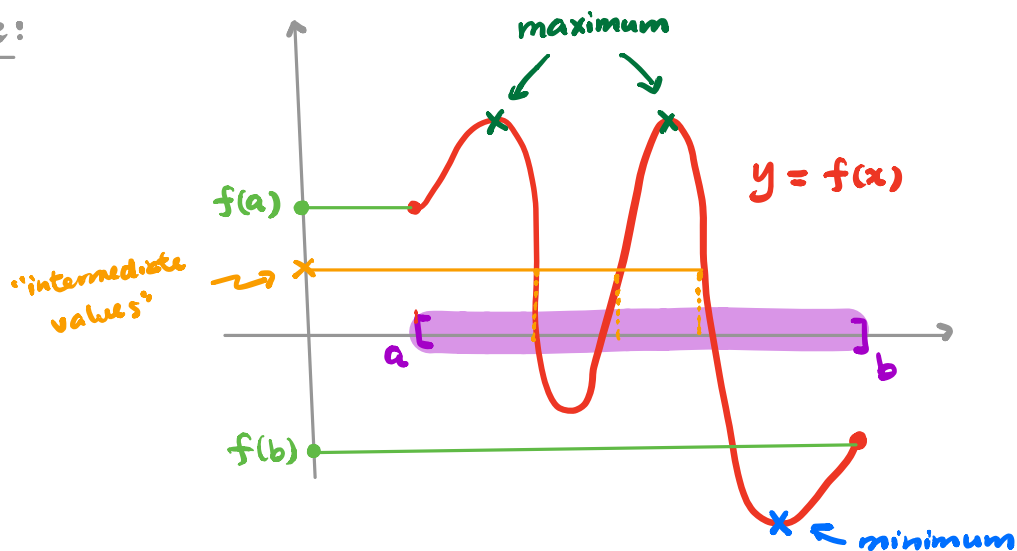

closed + bdd

Two Theorems for cts $f: [a, b] \rightarrow \mathbb{R}$ §5.3

Extreme Value Thm: f achieves its absolute maximum and minimum.

Intermediate Value Thm: f achieves ALL intermediate values between $f(a)$ and $f(b)$.

Picture:

Def²: §5.4

$f: A \rightarrow \mathbb{R}$
is uniformly cts
(on A)

$\Leftrightarrow$

$\forall \varepsilon > 0, \exists \delta > 0$ st.
 $|f(u) - f(v)| < \varepsilon \quad \forall u, v \in A, |u - v| < \delta$

depends ONLY on ε , but NOT u, v

FACT: f unif. cts on $A \implies f$ cts on A (i.e. at ALL $c \in A$)

e.g.) $f(x) = x$

$\nLeftarrow$
 $\because \delta$ may depend
on $c \in A$

e.g. $f(x) = \frac{1}{x}$

Two Important Thm about uniform continuity §5.4

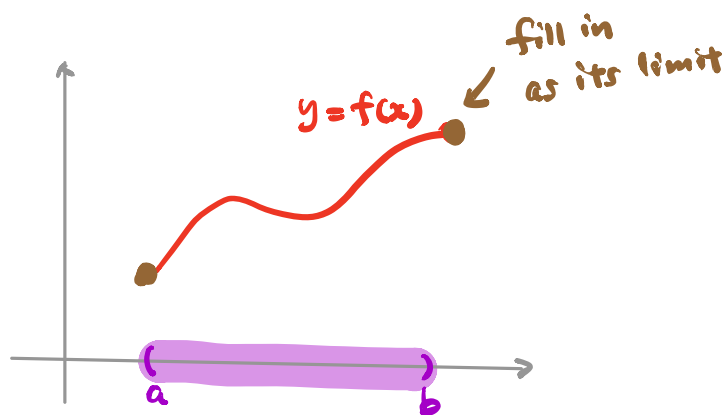

Uniform Continuity Thm:

Any cts $f: [a, b] \rightarrow \mathbb{R}$ is uniformly cts.
 $\uparrow$
closed + bdd

Continuous Extension Thm:

Any uniformly cts $f: (a, b) \rightarrow \mathbb{R}$ can be continuously
extended to $[a, b]$.
